

Answers Test 2, Intro Advanced Math, Oct 18 2019.

1. For each, simplify the cardinality to one of: $0, 1, 2, \dots, \aleph_0, c, 2^c, 2^{2^c}, \dots$.
No explanation is needed for (a)–(e). Do explain your answers for (f),(g).
 - (a) $\{3, 3, 3\}$. Cardinality is 1.
 - (b) $\mathbb{R} \setminus \mathbb{Q}$. Cardinality is c . [Any other answer would violate item 22]
 - (c) $\mathbb{N} \times \mathbb{Q}$. Cardinality is $\aleph_0 \cdot \aleph_0 = \aleph_0$.
 - (d) $P(\mathbb{Q})$. Cardinality is $2^{\aleph_0} = c$. [See items 23 and 24].
 - (e) $\mathbb{R}^{\mathbb{R}}$. Cardinality is $c^c = (2^{\aleph_0})^c = 2^{\aleph_0 c} = 2^c$.
 - (f) $\mathbb{R}^{\mathbb{N}}$. Cardinality is $c^{\aleph_0} = (2^{\aleph_0})^{\aleph_0} = 2^{\aleph_0 \aleph_0} = 2^{\aleph_0} = c$.
 - (g) Does there exist a bijection between $\mathbb{R}^{\mathbb{N}}$ and \mathbb{R} ?
Yes because question (f) showed that both have the same cardinality.
2. Give the definitions:
 - (a) A relation R on a set S is an *equivalence relation* when:
 - i. [Reflexive] $\forall_{x \in S} xRx$
 - ii. [Symmetric] $\forall_{x, y \in S} xRy \implies yRx$
 - iii. [Transitive] $\forall_{x, y, z \in S} xRy \wedge yRz \implies xRz$

[Here it is OK if you omitted the quantifier \forall .
It is also OK to write $(x, y) \in R$ instead of xRy]
 - (b) A function $f : A \rightarrow B$ is *onto* (*surjective*) when:
 $\forall_{b \in B} \exists_{a \in A} f(a) = b$.
[Here it is not OK if you omitted quantifiers, but it is always OK to write text like “for all” and “exists” instead of symbols like \forall and \exists .
It is also OK to use other letters than a, b .]
3. Suppose that $f : P(A) \rightarrow B$ is injective.
Prove that there is no injective function $g : B \rightarrow A$.
 $\text{card}(A) < \text{card}(P(A)) \leq \text{card}(B)$ (1).
[The $<$ is item 7, while the \leq is because f is injective]
Then an injective function $g : B \rightarrow A$ can not exist because that would imply $\text{card}(B) \leq \text{card}(A)$ contradicting (1).
4. Suppose that A_q is a set for every $q \in \mathbb{Q}$.
Suppose that for every $r \in \mathbb{R}$ there is some $q \in \mathbb{Q}$ for which $r \in A_q$.
Must there be some $q \in \mathbb{Q}$ for which A_q is uncountable?
Why or why not?
Yes, because if every A_q were countable, then $S := \bigcup_{q \in \mathbb{Q}} A_q$ would be a countable union of countable sets. Then S would be countable [item 19], contradicting the fact that every $r \in \mathbb{R}$ is in S .

5. Let C be a set, let A be a subset of C , and let $B = C \setminus A$. Suppose there is an injective function from B to A but not from C to A . Prove that C must be a finite set.

There is an injective function from B to A , so (a): $\text{card}(B) \leq \text{card}(A)$.

Suppose C is infinite. To Prove: a contradiction.

$C = A \cup B$ and $A \cap B = \emptyset$ so [see item 21:]

$$\begin{aligned}\text{card}(C) &= \text{card}(A) + \text{card}(B) \quad [\text{we can use item 22 because } C \text{ is infinite:}] \\ &= \max(\text{card}(A), \text{card}(B)) \\ &= \text{card}(A) \quad \text{by (a).}\end{aligned}$$

But $\text{card}(C) = \text{card}(A)$ contradicts the given statement that there is no injective function from C to A .

Items needed from the “List of facts on cardinal numbers” included in the test:

2. $\text{card}(A) \leq \text{card}(B)$ means $\exists f : A \rightarrow B$ with f one-to-one [Needed to know this in Ex 3 and Ex 5]
7. $\text{card}(A) < \text{card}(P(A))$ [**Must use this in Ex 3**]
19. If you have countably many sets, and if each of these sets is countable, then their union is also countable [**Must use this** or item 26 in Ex 4].
20. \mathbb{R} is uncountable [Need to know this in Ex 4]
21. If $d = \text{card}(D)$ and $e = \text{card}(E)$ then $d + e$ is the cardinality of $D \cup E$ if we assume that $D \cap E = \emptyset$ [**Must use this in Ex 5**].
22. If d, e are cardinal numbers, and if at least one of them is infinite, then $d + e = \max(d, e)$ [**Must use this in Ex 5**].
23. $\text{card}(P(A)) = 2^{\text{card}(A)}$ [Was used in Ex 1]
24. $c = \text{card}(\mathbb{R}) = 2^{\aleph_0}$ [Was used in Ex 1]
25. $(d_1 d_2)^e = d_1^e d_2^e$, $d^{e_1 + e_2} = d^{e_1} d^{e_2}$, $(d^e)^f = d^{ef}$ [Was used in Ex 1]
