Introduction

Differential operator and differential equation

Let

$$L = a_n \partial^n + a_{n-1} \partial^{n-1} + \dots + a_1 \partial + a_0$$

be a differential operator, with $a_n, a_{n-1}, \dots, a_1, a_0 \in \mathbb{C}(x)$ and n positive integer. The corresponding differential equation is

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \cdots + a_1 y' + a_0 y = 0.$$

Introduction

Differential operator and differential equation

Let

$$L = a_n \partial^n + a_{n-1} \partial^{n-1} + \dots + a_1 \partial + a_0$$

be a differential operator, with $a_n, a_{n-1}, \dots, a_1, a_0 \in \mathbb{C}(x)$ and n positive integer. The corresponding differential equation is

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \cdots + a_1 y' + a_0 y = 0.$$

We are interested in finding the Closed Form Solution of such second order differential equations.

Introduction

Gaussian Hypergeometric Function

Solving second order differential equations in terms of Bessel Functions are finished by Debeerst, Ruben (2007) and Yuan, Quan (2012). In this thesis we focus on a class of equations that can be solved in terms of **Hypergeometric Functions**.

$$_{2}F_{1}\left(\begin{array}{c|c}a,b\\c\end{array}\middle|x\end{array}\right)$$

which is represented by the hypergeometric series:

$$\sum_{n=0}^{\infty} \frac{(a)_n (b)_n}{(c)_n} \frac{z^n}{n!}$$

Traditional Methods of Solving Differential Operator L

- Direct solving by the existing techniques.
- Factor *L* as a product of lower order differential operators, then solve *L* by solving the lower order ones.
- Solve *L* in terms of lower order differential operator.

- Solve *L* in terms of lower order differential operator.

In this thesis we focus on second order linear differential equations (differential operators) which are irreducible and have no Liouvillian solutions.

Question: For the equations that we can't solve by the above techniques, what should we do?

Introduction Preliminaries Main Problems Algorithm Improved 2-descent Algorithm for Case A Finding ₂F₁ Solutions

Overview of the methods

We consider to reduce the differential operator L, if possible, to another differential operator \tilde{L} that is easier to solve (with same order, but with fewer true singularities) by using the 2-descent method or other descent methods.

- If the above 2-descent exists, we find \tilde{L} .
- ⁽²⁾ If the number of true singularities of \tilde{L} drops to 3, we find its ${}_2F_1$ -type solutions, furthermore, find the ${}_2F_1$ solution of L in terms of \tilde{L} 's.
- If the number of true singularities of L̃ drops to 4, we can decide if L̃, furthermore L, ∃ ₂F₁-type solutions by building a large table that covers the differential operators with 4 true singularities.

- Compoint, van Hoeij, van der Put reduced the problem of 2-descent to another problem, which involved in trivializing a 2-cocycle.
 - No explicit algorithms are given.
- van Hoeij proposed that we first compute the symmetric product of L and $\sigma(L)$, and then factor it to the product of a first order equation and third order equation and then use another method to find the equivalent second order differential equation of the third order factor.
 - The method here involves to calculate the point on a conic. Algorithms were only given when the conic is defined over Q or the transcendental of Q. NO algorithms are given for the general ground field.

Theorem

Let *L* and σ be as before, and $G: V(L) \to V(\sigma(L))$ be a gauge transformation. Suppose $\tilde{L_1}$, $\tilde{L_2} \in \mathbb{C}(f)[\partial_f]$ and $A_i: V(L) \to V(\tilde{L_i})$ are gauge transformations. Then:

• For each i = 1, 2, there is exactly one $\lambda_i \in \mathbb{C}^*$ such that

2 If
$$\tilde{L_1} \sim_g \tilde{L_2}$$
 over $\mathbb{C}(f)$, then $\lambda_1 = \lambda_2$; Otherwise, $\lambda_1 = -\lambda_2$.

3 In particular, $\{\lambda_1, -\lambda_1\}$ depends only on (L, σ, G) .

Finding the projectively equiva	alent operator \tilde{L}		
Finding \tilde{L} in (Case A		

 $A - \sigma(A)\lambda G$ becomes a map from V(L) to $V(\tilde{L})$, and has a nonzero kernel. This kernel corresponds to a right hand factor of L, since L is irreducible, the kernel is V(L) itself.

 $A - \sigma(A)\lambda G$ right divided by L, and this gives us 4 equations for coefficients of A.

Example 3

$$\begin{split} L &= \partial^2 + \frac{8(8x+1)}{(4x+1)(4x-1)}\partial + \frac{4(8x+1)}{x(4x-1)(4x+1)}.\\ \text{One of the candidates we found for } \sigma \text{ is } -x \text{ and } \\ G &= \frac{x(4x-1)}{4x+1}\partial + \frac{12x+1}{2(4x+1)}.\\ \text{We implement the algorithm as follows:} \end{split}$$

- Write $A = (a_{10} + a_{11}x)\partial + (a_{00} + a_{01}x)$, with a_{00} , a_{01} , a_{10} , a_{11} unknown and over $\mathbb{C}(f)$.
- Get σ(A) = −(a₁₀ − a₁₁x)∂ + a₀₀ − a₀₁x. Set the remainder of A − σ(A)λG right divided by L to be 0. We get a set of the coefficients as:

 $\{2a_{01} - 16\lambda a_{00} + \lambda a_{01} - 64\lambda a_{10} + 32fa_{10} + 48f\lambda a_{01} + 16a_{00}, \\ 16fa_{01} + 2a_{00} + 32fa_{00} + 64f\lambda a_{11} - \lambda a_{00} - 48f\lambda a_{00} + 16f\lambda a_{01}, \\ 16\lambda a_{10} + 2\lambda a_{00} + 32fa_{11} + 48f\lambda a_{11} - 32f\lambda a_{00} + 16a_{10} + \\ \lambda a_{10} + 2\lambda a_{00} + 32fa_{11} + 48f\lambda a_{11} - 32f\lambda a_{00} + 16a_{10} + \\ \lambda a_{10} + 2\lambda a_{10} + 32fa_{11} + 48f\lambda a_{11} - 32f\lambda a_{10} + 16f\lambda a_{10} + \\ \lambda a_{10} + 2\lambda a_{10} + 32fa_{10} + 32fa_{10} + 32fa_{10} + 32f\lambda a_{10} + 32f\lambda a_{10$

Example 3

$$L = \partial^2 + \frac{8(8x+1)}{(4x+1)(4x-1)}\partial + \frac{4(8x+1)}{x(4x-1)(4x+1)}.$$

One of the candidates we found for σ is $-x$ and $G = \frac{x(4x-1)}{4x+1}\partial + \frac{12x+1}{2(4x+1)}.$
We implement the algorithm as follows:

- Write $A = (a_{10} + a_{11}x)\partial + (a_{00} + a_{01}x)$, with a_{00} , a_{01} , a_{10} , a_{11} unknown and over $\mathbb{C}(f)$.
- Get σ(A) = −(a₁₀ − a₁₁x)∂ + a₀₀ − a₀₁x. Set the remainder of A − σ(A)λG right divided by L to be 0. We get a set of the coefficients as:

 $\{2a_{01} - 16\lambda a_{00} + \lambda a_{01} - 64\lambda a_{10} + 32fa_{10} + 48f\lambda a_{01} + 16a_{00},$

 $16f_{a_{01}} + 2a_{00} + 32f_{a_{00}} + 64f\lambda a_{11} - \lambda a_{00} - 48f\lambda a_{00} + 16f\lambda a_{01},$

 $16\lambda a_{10} + 2\lambda a_{00} + 32fa_{11} + 48f\lambda a_{11} - 32f\lambda a_{00} + 16a_{10} +$

 $\lambda a_{11} + 2a_{11}, -16f \lambda a_{11} + 2a_{10} + 32f^2 \lambda a_{01} + 16f a_{11} - 48f \lambda a_{10} - 6f \lambda a_$

Example 3

$$L = \partial^2 + \frac{8(8x+1)}{(4x+1)(4x-1)}\partial + \frac{4(8x+1)}{x(4x-1)(4x+1)}.$$

One of the candidates we found for σ is $-x$ and $G = \frac{x(4x-1)}{4x+1}\partial + \frac{12x+1}{2(4x+1)}.$
We implement the algorithm as follows:

- Write $A = (a_{10} + a_{11}x)\partial + (a_{00} + a_{01}x)$, with a_{00} , a_{01} , a_{10} , a_{11} unknown and over $\mathbb{C}(f)$.
- Get σ(A) = −(a₁₀ − a₁₁x)∂ + a₀₀ − a₀₁x. Set the remainder of A − σ(A)λG right divided by L to be 0. We get a set of the coefficients as:

$$\{ 2a_{01} - 16\lambda a_{00} + \lambda a_{01} - 64\lambda a_{10} + 32fa_{10} + 48f\lambda a_{01} + 16a_{00}, \\ 16fa_{01} + 2a_{00} + 32fa_{00} + 64f\lambda a_{11} - \lambda a_{00} - 48f\lambda a_{00} + 16f\lambda a_{01}, \\ 16\lambda a_{10} + 2\lambda a_{00} + 32fa_{11} + 48f\lambda a_{11} - 32f\lambda a_{00} + 16a_{10} + \\ \lambda a_{11} + 2a_{11}, -16f\lambda a_{11} + 2a_{10} + 32f^2\lambda a_{01} + 16fa_{11} - 48f\lambda a_{10} - \\ \lambda a_{10} + 32fa_{10} - 2f\lambda a_{01} \}.$$

- Equate the determinant of the corresponding matrix M det(M) to 0 gives a degree 4 equation for λ. Solve for λ.
- Plug in one value for λ in M, then solve M to find values for $a_{00}, a_{01}, a_{10}, a_{11}$ in A. We take $\lambda = 2$ and get

$$A = (\frac{4}{3}x^2 - \frac{1}{12})\partial + \frac{4x}{3} + 1$$

$$\tilde{L} = (16x_1 - 1)x_1\partial^2 + (32x_1 - 1)\partial + 4$$

- Equate the determinant of the corresponding matrix M det(M) to 0 gives a degree 4 equation for λ. Solve for λ. det(M) = 65536(λ − 2)² · (λ + 2)² · (f − 1/16)⁴ and λ = ±2.
- Plug in one value for λ in M, then solve M to find values for $a_{00}, a_{01}, a_{10}, a_{11}$ in A. We take $\lambda = 2$ and get

$$A = (\frac{4}{3}x^2 - \frac{1}{12})\partial + \frac{4x}{3} + 1$$

$$\tilde{L} = (16x_1 - 1)x_1\partial^2 + (32x_1 - 1)\partial + 4$$

Case B					

<u>Case B</u> is when $L \sim_p \sigma(L)$, in other words, there exists $G = e^{\int r} \cdot (r_0 + r_1 \partial)$ such that $G(V(L)) = V(\sigma(L))$.

<u>Case B</u> is when $L \sim_{p} \sigma(L)$, in other words, there exists $G = e^{\int r} \cdot (r_0 + r_1 \partial)$ such that $G(V(L)) = V(\sigma(L))$.

Difficulty

We have an exponential part in G comparing with **Case A**. The algorithm mentioned above fails.

<u>Case B</u> is when $L \sim_{p} \sigma(L)$, in other words, there exists $G = e^{\int r} \cdot (r_0 + r_1 \partial)$ such that $G(V(L)) = V(\sigma(L))$.

Difficulty

We have an exponential part in G comparing with **Case A**. The algorithm mentioned above fails.

Solution

After multiplying solution of L by a suitable $e^{\int s}$, we can reduce this case to Case A.

Main Problems Algorithm

Improved 2-descent Algorithm for Case A $Finding _2F_1$ Solutions

Problem of 2-descent, Case A

Andantage and Disadvantage of 2-descent, Case A

To decide \tilde{L} , we first compute λ and then a set of linear equations to determine $A = (a_{10} + a_{11}x)\partial + (a_{00} + a_{01}x)$.

Advantage

This algorithm does give us one \tilde{L} which is equivalent to our input L.

Disadvantage

When we compute A, we select one $(a_{00}, a_{01}, a_{10}, a_{11})$ from a vector space of dimension 2, that means our output \tilde{L} is just one member of a 2-dimensional set of possible outcomes. We can't expect \tilde{L} to have the optimal size.

Main Problems Algorithm

Improved 2-descent Algorithm, Case A

What is improved in the new Algorithm

The improved algorithm will avoid computing a set of possible $\tilde{L}s$ and apt to give a smaller output.

Lemma

Given a second order irreducible differential operator L and second order automorphism σ as in Section 3.4, and a gauge transformation $G: V(L) \rightarrow V(\sigma(L))$, then there exist a constant λ such that the following diagram commutes.

Lemma

Given a second order irreducible differential operator L and second order automorphism σ as in Section 3.4, and a gauge transformation $G: V(L) \rightarrow V(\sigma(L))$, then there exist a constant λ such that the following diagram commutes.

Questions: with the above diagram, do we have the \tilde{L} already? Is L_4 the descent we want? If not, how do we find \tilde{L} ?

Questions: with the above diagram, do we have the \tilde{L} already? Is L_4 the descent we want? If not, how do we find \tilde{L} ?

Theorem

Given a second order differential operator L. σ , G, λ are as stated previously in the diagram. Then there exists a second order differential operator \tilde{L} such that \tilde{L} is invariant under σ and $(1 + \lambda G)V(L) = V(\tilde{L})$.

Questions: with the above diagram, do we have the \tilde{L} already? Is L_4 the descent we want? If not, how do we find \tilde{L} ?

Theorem

Given a second order differential operator L. σ , G, λ are as stated previously in the diagram. Then there exists a second order differential operator \tilde{L} such that \tilde{L} is invariant under σ and $(1 + \lambda G)V(L) = V(\tilde{L})$.

Computing \tilde{L}

- Compute $M := \text{LCLM}(L, 1 + \lambda G)$.
- **2** Compute the \tilde{L} such that $M = \tilde{L}(1 + \lambda G)$.
- Verify $V(\tilde{L}) \subseteq V(L_4)$ and $V(\sigma(\tilde{L})) = V(\tilde{L})$

To find the $_2F_1$ Solutions, we need connect with the hypergeometric equations, which have the following properties

- (a) Three true regular singularities, located at $0, 1, \infty$.
- (b) No apparent singularities.

(日)

(a) Three true regular singularities, located say at p₁, p₂, p₃ ∈ ℙ¹.
(b) Any number of apparent singularities.

Introduction Preliminaries Main Problems Algorithm Improved 2-descent Algorithm for Case A Finding ₂F₁ Solutions

What we have for \tilde{L} ?

- (a) Three true regular singularities, located say at $p_1, p_2, p_3 \in \mathbb{P}^1$.
- (b) Any number of apparent singularities.

To solve \tilde{L} in terms of hypergometric functions, we need to apply two types of transformations:

- (a) A Möbius transformation (a change of variables) to move p1, p2, p3 to $0, 1, \infty$.
- (b) A projective equivalence \sim_p to eliminate all apparent singularities.

Classification of Gauss Hypergeometric Equations

Classification of Gauss Hypergeometric Equations

Theorem

Let L_1, L_2 be two Gauss hypergeometric differential operators. Assume the exponent difference set of L_1 at $0, 1, \infty$ is $\{e_0, e_1, e_\infty\}$, and the exponent difference set of L_2 at $0, 1, \infty$ is $\{d_0, d_1, d_\infty\}$. If

2)
$$\sum_{i \in \{0,1,\infty\}} (e_i - d_i)$$
 is an even integer,

Then $L_1 \sim_p L_2$.

Classification of Gauss Hypergeometric Equations

Theorem

Let L_1, L_2 be two Gauss hypergeometric differential operators. Assume the exponent difference set of L_1 at $0, 1, \infty$ is $\{e_0, e_1, e_\infty\}$, and the exponent difference set of L_2 at $0, 1, \infty$ is $\{d_0, d_1, d_\infty\}$. If

$$\begin{array}{ll} \bullet_i - d_i \in \mathbb{Z} \text{ for all } i \in \{0, 1, \infty\} \\ \text{and} \end{array}$$

2
$$\sum_{i \in \{0,1,\infty\}} (e_i - d_i)$$
 is an even integer,

Then $L_1 \sim_p L_2$.

Corollary

Let L_1, L_2 be two Gauss hypergeometric differential operator. Assume the exponent difference set of L_1 at $0, 1, \infty$ is $\{e_0, e_1, e_\infty\}$, and the exponent difference set of L_2 at $0, 1, \infty$ is $\{d_0, d_1, d_\infty\}$. If $\frac{1}{2} + \mathbb{Z}$ appears in $\{e_0, e_1, e_\infty\}$ and $\{d_0, d_1, d_\infty\}$, then L_1 is projectively equivalent to L_2 if $e_i - d_i \in \mathbb{Z}$ for all $i \in \{0, 1, \infty\}$.

Possible Hypergeometric Equations corresponding to \tilde{L}

Lemma

Suppose *L* is projectively equivalent to a hypergeometric equation. suppose that the exponent-differences of *L* at 0, 1, ∞ are d_0, d_1, d_∞ . Let L_1 be a hypergeometric equation with exponent-differences: d_0, d_1, d_∞ and L_2 be a hypergeometric equation with exponent-differences: $d_0 + 1, d_1, d_\infty$. Then $L \sim_p L_1$ or $L \sim_p L_2$ (both are true if $\{d_0, d_1, d_\infty\} \bigcap \{\frac{1}{2} + \mathbb{Z}\} \neq \emptyset$).

Possible Hypergeometric Equations corresponding to \tilde{L}

Lemma

Suppose *L* is projectively equivalent to a hypergeometric equation. suppose that the exponent-differences of *L* at 0, 1, ∞ are d_0, d_1, d_∞ . Let L_1 be a hypergeometric equation with exponent-differences: d_0, d_1, d_∞ and L_2 be a hypergeometric equation with exponent-differences: $d_0 + 1, d_1, d_\infty$. Then $L \sim_p L_1$ or $L \sim_p L_2$ (both are true if $\{d_0, d_1, d_\infty\} \bigcap \{\frac{1}{2} + \mathbb{Z}\} \neq \emptyset$).

With these exponent-differences d_0, d_1, d_∞ at $0, 1, \infty$, we construct the gauss hypergeometric equations by the following fomular:

$$x(x-1)\partial^2 - (-2x + xd_0 + xd_1 + 1 - d_0)\partial + \frac{(d_0 - 1 + d_1 + d_\infty)(d_0 - 1 + d_1 - d_\infty)}{4}$$

Algorithm for finding $_2F_1$ Solutions

Having these theorems, we have evidences to find the $_2F_1$ solution of our $\widetilde{\mathcal{L}}.$

- Compute the exponent-difference at the three singularities of *L̃* module Z. Denote them as e₁, e₂, e₃.
- **②** Find the two Gauss hypergeometric equations L_1, L_2 by the formula and theorem.
- Find the Möbius transformation m(x) between p₁, p₂, p₃ and 0, 1, ∞.
- Call **equiv** to check if L_1 or L_2 (after change of variable) is projectively equivalent to \tilde{L} , if so, go to next step. Denote the equivalence as G
- Find the Gauss hypergeometric solutions of $Sol := C_1y_1(m(x)) + C_2y_2(m(x))$ if $e_1 \neq 0$, otherwise, compute $Sol := C_1y_1(m(x)) + C_2y'_2(m(x))$.
- Compute the $_2F_1$ -type solution of \tilde{L} by computing G(Sol).

Final solving by 2-descent

Input: A second order irreducible differential operator $L \in C(x)[\partial]$ and the field C.

Output: ₂*F*₁-type solution, if it exists..

- Call Algorithm 2-descent in Chapter 3 to Compute the 2-descent of L, L, if it exists.
- **2** Compute the true singularities of \tilde{L} .
- If L̃ has 3 true regular singularities, then call Algorithm finding 2F₁-type solution with 3 singularities and find the solution *sol*; Otherwise, stop and return NULL.
- Apply the Change of variable $x \mapsto f$ to \tilde{L} , Sol, we get $\tilde{L'}$ and its $_2F_1$ solution Sol'.
- Solution Compute the equivalence G between $\tilde{\mathcal{L}}'$ and \mathcal{L} .
- Compute the ${}_2F_1$ -type solution of *L* by computing G(Sol').
Introduction Preliminaries Main Problems Algorithm Improved 2-descent Algorithm for Case A Finding ₂F₁ Solutions

Example 5

Let

$$L = \partial^{2} + \frac{28x - 5}{x(4x - 1)}\partial + \frac{144x^{2} + 20x - 3}{x^{2}(4x - 1)(4x + 1)}$$

Step 1: Compute the 2-descent of L from Section 3.7, we have

$$ilde{\mathcal{L}}:=(16x-1)x\partial^2+(32x-2)\partial+4$$

step 2: Compute the true singularities of \tilde{L} , we found it has 3 true regular singularities: $0, \frac{1}{16}, \infty$. **step 3:** Call Algorithm finding $_2F_1$ -type solution with 3 singularities, we found the $_2F_1$ solution of \tilde{L} as

$$Sol := C_1(64x-4)_2 F_1(\frac{3}{2}, \frac{3}{2}; 2; 16x) - C_2(64x-4)_2 F_1(\frac{3}{2}, \frac{3}{2}; 2; 1-16x)$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Example 5, continued...

Step 4: From Section 3.7, we know that $f = x^2$, so the change of variable would be $x \mapsto x^2$. Apply transformation to \tilde{L} and *Sol*, we have

$$\tilde{L}' := x(4x+1)(4x-1)\partial^2 + (12x-3)(4x+1)\partial + 16x$$

Sol' := $C_1(64x^2-4)_2F_1(\frac{3}{2},\frac{3}{2};2;16x^2) - C_2(64x^2-4)_2F_1(\frac{3}{2},\frac{3}{2};2;1-16x^2)$

Step 5: Compute the equivalence between \tilde{L}' and L, we have

$$G:=\frac{1}{x(4x-1)}$$

Step 6: Compute G(Sol'), we have the final solution as

$$C_1 \frac{16x+1}{x} {}_2F_1(\frac{3}{2}, \frac{3}{2}; 2; 16x^2) - C_2 \frac{16x+1}{x} {}_2F_1(\frac{3}{2}, \frac{3}{2}; 2; 1-16x^2)$$

We focus on finding the hypergeometric solutions of second order linear equations. Contributions of this theis are:

- Developed 2-descent algorithms to reduce our differential equation to one with fewer true singularities.
- 2 Improved the 2-descent algorithm to produce shorter output, which is helpful for finding the ${}_2F_1$ solutions.
- **③** Finding the ${}_2F_1$ solutions.

Work may be done in future:

- Extend the 2-descent algorithm to bigger descent, for example: C₂ × C₂, D_n, A₄, S₄, or A₅.
- Extend the 2-descent to 3-descent, for which the index of the descent subfield is 3.

Thank Dr. van Hoeij for the continuous support, encouragement, the guide of research and interest.

Thank every committee member for devoting time to reading this dissertation and giving me suggestions.
