# Volumes spanned by k-point configurations in $\mathbb{R}^d$

#### Alex McDonald (joint work with Belmiro Galo)

Point Distribution Webinar July 2021

#### • For $E \subset \mathbb{R}^d$ , define the distance set of E to be

$$\Delta(E) := \{ |x - y| : x, y \in E \}.$$

(ロ)、(型)、(E)、(E)、 E) の(()

For  $E \subset \mathbb{R}^d$ , define the distance set of E to be

$$\Delta(E) := \{ |x - y| : x, y \in E \}.$$

■ The Falconer distance problem asks, for compact E ⊂ ℝ<sup>d</sup>, how large the Hausdorff dimension of E must be to ensure that Δ(E) has positive (1-dimensional) Lebesgue measure.

For  $E \subset \mathbb{R}^d$ , define the distance set of E to be

$$\Delta(E) := \{ |x - y| : x, y \in E \}.$$

- The Falconer distance problem asks, for compact E ⊂ ℝ<sup>d</sup>, how large the Hausdorff dimension of E must be to ensure that Δ(E) has positive (1-dimensional) Lebesgue measure.
- Falconer (1986) proved that the threshold dim E > d+1/2 was sufficient, and that no threshold below d/2 is sufficient. The conjectured best threshold is d/2.

■ In 1999 Wolff proved the threshold 4/3 in dimension 2, and in 2005 Erdogan proved  $\frac{d}{2} + \frac{1}{3}$  for  $d \ge 3$ .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

In 1999 Wolff proved the threshold 4/3 in dimension 2, and in 2005 Erdogan proved  $\frac{d}{2} + \frac{1}{3}$  for  $d \ge 3$ .

The best current results are

$$\begin{cases} 5/4, & d = 2(Guth, Iosevich, Ou, Wang) \\ 9/5, & d = 3(Du, Guth, Iosevich, Ou, Wang, Zhang) \\ \frac{d}{2} + \frac{1}{4}, & d \ge 4, d \text{ even } (Du, Iosevich, Ou, Wang, Zhang) \\ \frac{d}{2} + \frac{1}{4} + \frac{1}{4(d-1)}, & d \ge 4, d \text{ odd } (Du, Zhang) \end{cases}$$

The left hand side has limit ν(A), so it suffices to prove a bound on ||ν<sup>ε</sup>||<sub>L<sup>2</sup></sub> which is independent of ε.

Strategy for configuration problems

This strategy generalizes easily.

- This strategy generalizes easily.
- Given  $\Phi: (\mathbb{R}^d)^N \to \mathbb{R}^M$ , define  $\nu$  by

$$\int f(t) d\nu(t) = \int f(\Phi(x^1, ..., x^N)) d\mu(x^1) \cdots d\mu(x^N).$$

This strategy generalizes easily.

• Given  $\Phi: (\mathbb{R}^d)^N \to \mathbb{R}^M$ , define  $\nu$  by

$$\int f(t) d\nu(t) = \int f(\Phi(x^1,...,x^N)) d\mu(x^1) \cdots d\mu(x^N).$$

■ If  $\|\nu^{\varepsilon}\|_{L^2}$  is bounded independent of  $\varepsilon$ , then  $\{\Phi(x^1, ..., x^N) : x^i \in E\}$  has positive measure.

• A (k + 1)-point configuration in  $\mathbb{R}^d$  is simply an element of  $(\mathbb{R}^d)^{k+1}$ , i.e., a k + 1 tuple  $x = (x^1, ..., x^{k+1})$  where each  $x^i = (x_1^i, ..., x_d^i)$  is a vector in  $\mathbb{R}^d$ .

- A (k + 1)-point configuration in  $\mathbb{R}^d$  is simply an element of  $(\mathbb{R}^d)^{k+1}$ , i.e., a k + 1 tuple  $x = (x^1, ..., x^{k+1})$  where each  $x^i = (x_1^i, ..., x_d^i)$  is a vector in  $\mathbb{R}^d$ .
- We say (k + 1)-point configurations x and y are congruent, and write  $x \sim y$ , if there exists  $\theta \in O(\mathbb{R}^d), z \in \mathbb{R}^d$  such that for all i = 1, ..., k + 1 we have  $y^i = \theta x^i + z$  (briefly,  $y = \theta x + z$ ).

- A (k + 1)-point configuration in  $\mathbb{R}^d$  is simply an element of  $(\mathbb{R}^d)^{k+1}$ , i.e., a k + 1 tuple  $x = (x^1, ..., x^{k+1})$  where each  $x^i = (x_1^i, ..., x_d^i)$  is a vector in  $\mathbb{R}^d$ .

- Question: Given a compact set E ⊂ ℝ<sup>d</sup>, how large must dim E be to ensure Δ<sub>k</sub>(E) has positive measure?
- In order to pose this question, we must choose a measure on  $\Delta_k(E)$ .
- The choice of measure depends on whether  $k \leq d$  or k > d.
- When k ≤ d, each of the pairwise distances may be chosen independently. We may therefore identify Δ<sub>k</sub>(E) with a subset of ℝ<sup>(k+1)</sup>/<sub>2</sub>, equipped with (<sup>k+1</sup>/<sub>2</sub>)-dimensional Lebesgue measure.

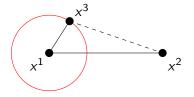

#### Example: The case k = d = 2

• Let  $x = (x^1, x^2, x^3)$  be a 3-point configuration in  $\mathbb{R}^2$ .

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

#### Example: The case k = d = 2

• Let  $x = (x^1, x^2, x^3)$  be a 3-point configuration in  $\mathbb{R}^2$ .

• If we fix  $|x^1 - x^2| = a$  and  $|x^1 - x^3| = b$ , the last distance  $|x^2 - x^3|$  could take any value between |a - b| and a + b.

#### Theorem (Greenleaf-Iosevich-Liu-Palsson, 2015)

Let  $k \leq d$ , and let  $E \subset \mathbb{R}^d$  be a compact set. If

$$\dim E > d - \frac{d-1}{k+1},$$

then  $\Delta_k(E)$  has positive  $\binom{k+1}{2}$ -dimensional Lebesgue measure.

#### Theorem (Greenleaf-Iosevich-Liu-Palsson, 2015)

Let  $k \leq d$ , and let  $E \subset \mathbb{R}^d$  be a compact set. If

$$\dim E > d - \frac{d-1}{k+1},$$

then  $\Delta_k(E)$  has positive  $\binom{k+1}{2}$ -dimensional Lebesgue measure.

In the case k = 1 this coincides with Falconer's  $\frac{d+1}{2}$  threshold.

#### • When k > d, the system of equations

$$|x^i - x^j| = t_{i,j}|$$

becomes overdetermined; by fixing some of the values  $t_{i,j}$  we determine the others.

#### • When k > d, the system of equations

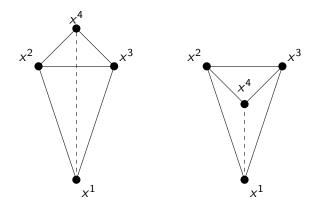

$$|x^i - x^j| = t_{i,j}|$$

becomes overdetermined; by fixing some of the values  $t_{i,j}$  we determine the others.

In this case we may still identify ∆<sub>k</sub>(E) with <sup>(k+1)</sup><sub>2</sub>-tuples of pairwise distances, but the resulting subset of ℝ<sup>(k+1)</sup><sub>2</sub> has measure zero.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Example: The case k = 3, d = 2

With 4 points, if we fix 5 of the pairwise distances there are only 2 choices for the last distance.

## Overdetermined congruence problem

Say that a configuration x is non-degenerate if x<sup>1</sup>,..., x<sup>d+1</sup> are affinely independent.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

## Overdetermined congruence problem

- Say that a configuration x is non-degenerate if x<sup>1</sup>,..., x<sup>d+1</sup> are affinely independent.
- Two non-degenerate configurations x, y are congruent if and only if there exists θ ∈ O(ℝ<sup>d</sup>), z ∈ ℝ<sup>d</sup> such that y = θx + z.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

## Overdetermined congruence problem

- Say that a configuration x is non-degenerate if x<sup>1</sup>,...,x<sup>d+1</sup> are affinely independent.
- Two non-degenerate configurations x, y are congruent if and only if there exists θ ∈ O(ℝ<sup>d</sup>), z ∈ ℝ<sup>d</sup> such that y = θx + z.
- The non-degenerate congruence classes can be identified with a space of dimension *m*, where

$$m=d(k+1)-\binom{d+1}{2}$$

# Theorem (Chatzikonstantinou-Iosevich-Mkrtchyan-Pakianathan, 2017)

Let  $d \ge 2$  and  $k \ge 1$ , and let  $m = d(k+1) - \binom{d+1}{2}$ . Let  $E \subset \mathbb{R}^d$  be compact. If dim  $E > d - \frac{1}{k+1}$ , then  $\Delta_k(E)$  has positive *m*-dimensional measure.

# Theorem (Chatzikonstantinou-Iosevich-Mkrtchyan-Pakianathan, 2017)

Let  $d \ge 2$  and  $k \ge 1$ , and let  $m = d(k+1) - \binom{d+1}{2}$ . Let  $E \subset \mathbb{R}^d$  be compact. If dim  $E > d - \frac{1}{k+1}$ , then  $\Delta_k(E)$  has positive *m*-dimensional measure.

 This approach generalizes to other overdetermined configuration problems if the relevant geometric features can be characterized in terms of a group action.

Theorem (Greenleaf-Iosevich-Taylor, 2020)

Given  $E \subset \mathbb{R}^d$ , define

$$\mathcal{V}(E) = \{\det(x^1,...,x^d) : x^i \in E\}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

If  $E \subset \mathbb{R}^d$  is compact and dim  $E > d - 1 + \frac{1}{d}$ , then  $\mathcal{V}(E)$  has non-empty interior.

Theorem (Greenleaf-Iosevich-Taylor, 2020)

Given  $E \subset \mathbb{R}^d$ , define

$$\mathcal{V}(E) = \{\det(x^1, ..., x^d) : x^i \in E\}$$

If  $E \subset \mathbb{R}^d$  is compact and dim  $E > d - 1 + \frac{1}{d}$ , then  $\mathcal{V}(E)$  has non-empty interior.

■ If dim E ≤ d − 1 then E may be contained in a hyperplane and determine no non-trivial volumes.

Theorem (Greenleaf-Iosevich-Taylor, 2020)

Given  $E \subset \mathbb{R}^d$ , define

$$\mathcal{V}(E) = \{\det(x^1,...,x^d): x^i \in E\}$$

If  $E \subset \mathbb{R}^d$  is compact and dim  $E > d - 1 + \frac{1}{d}$ , then  $\mathcal{V}(E)$  has non-empty interior.

- If dim E ≤ d − 1 then E may be contained in a hyperplane and determine no non-trivial volumes.
- It follows the threshold  $d 1 + \frac{1}{d}$  cannot be improved by more than  $\frac{1}{d}$ .

$$u^arepsilon_{d,d}(t)pproxarepsilon^{-1}\int_{|\det(x^1,...,x^d)-t|$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三 ● ● ●

#### We have

$$u_{d,d}^{\varepsilon}(t) pprox \varepsilon^{-1} \int_{|\det(x^1,...,x^d)-t|<\varepsilon} d\mu^d(x)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

• Let  $\psi$  be a Schwartz function supported in the range  $\frac{1}{2} \leq |\xi| \leq 4$  and constantly equal to 1 in the range  $1 \leq |\xi| \leq 2$ , and let  $\hat{\mu}_j(\xi) = \psi(2^{-j}\xi)\hat{\mu}(\xi)$  be the corresponding Littlewood-Paley projection.

#### We have

$$u_{d,d}^{\varepsilon}(t) pprox \varepsilon^{-1} \int_{|\det(x^1,...,x^d)-t|<\varepsilon} d\mu^d(x)$$

• Let  $\psi$  be a Schwartz function supported in the range  $\frac{1}{2} \leq |\xi| \leq 4$  and constantly equal to 1 in the range  $1 \leq |\xi| \leq 2$ , and let  $\hat{\mu}_j(\xi) = \psi(2^{-j}\xi)\hat{\mu}(\xi)$  be the corresponding Littlewood-Paley projection.

The above integral is

$$\varepsilon^{-1} \sum_{j_1 > \dots > j_d > 0} \int_{|\det(x^1, \dots, x^d) - t| < \varepsilon} \mu_{j_1}(x^1) \cdots \mu_{j_d}(x^d) \, dx$$

Define a generalized Radon transform by

$$\mathcal{R}_t f(x^1, \cdots, x^{d-1}) = \int_{\substack{\det(x^1, \cdots, x^d) = t \\ |x^1|, \dots, |x^d| \le 1}} f(x^d) \, d\sigma_{t, x^1, \cdots, x^{d-1}}(x^d),$$

where  $\sigma_{t, x^1, \cdots, x^{d-1}}$  is the surface measure.

Define a generalized Radon transform by

$$\mathcal{R}_t f(x^1, \cdots x^{d-1}) = \int_{\substack{\det(x^1, \cdots, x^d) = t \\ |x^1|, \dots, |x^d| \le 1}} f(x^d) \, d\sigma_{t, x^1, \cdots, x^{d-1}}(x^d),$$

where  $\sigma_{t,x^1,\cdots,x^{d-1}}$  is the surface measure.

We have

$$u_{d,d}^{\varepsilon}(t) \approx \sum_{j} \langle \mathcal{R}_t \mu_j, \mu_j \otimes \cdots \otimes \mu_j \rangle$$

Define a generalized Radon transform by

$$\mathcal{R}_t f(x^1, \cdots x^{d-1}) = \int_{\substack{\det(x^1, \cdots, x^d) = t \\ |x^1|, \dots, |x^d| \le 1}} f(x^d) \, d\sigma_{t, x^1, \cdots, x^{d-1}}(x^d),$$

where  $\sigma_{t,x^1,\cdots,x^{d-1}}$  is the surface measure.

We have

$$u_{d,d}^{\varepsilon}(t) pprox \sum_{j} \langle \mathcal{R}_t \mu_j, \mu_j \otimes \cdots \otimes \mu_j \rangle$$

The Greenleaf-losevich-Taylor result is obtained from this by studying the mapping properties of generalized Radon transforms.

### Properties of generalized Radon Transforms

•  $\mathcal{R}_t \mu_j$  has Fourier support concentrated at scale  $2^j$ 

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

#### Properties of generalized Radon Transforms

- $\mathcal{R}_t \mu_j$  has Fourier support concentrated at scale  $2^j$
- $\mathcal{R}_t$  is a bounded map  $L^2 \to L^2_{\frac{d-1}{2}}$ , where  $L^2_r$  denotes the Sobolev space with norm

$$||f||_{L^2_r} = ||(1+|\xi|^2)^{r/2}\widehat{f}(\xi)||_{L^2}.$$

## Distance chains

• Let G be a graph on the vertices  $\{1, ..., k\}$ .

## **Distance chains**

• Let G be a graph on the vertices  $\{1, ..., k\}$ .

A natural Falconer-type question about point configurations asks how large the Hausdorff dimension of a set must be to ensure it determines a positive measure worth of distances corresponding to edges.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

## **Distance chains**

• Let G be a graph on the vertices  $\{1, ..., k\}$ .

- A natural Falconer-type question about point configurations asks how large the Hausdorff dimension of a set must be to ensure it determines a positive measure worth of distances corresponding to edges.
- The following result applies when *G* is a chain.

Theorem (Bennett-Iosevich-Taylor, 2015)

Let  $d, k \geq 2$ , and let  $E \subset \mathbb{R}^d$  be compact. If dim  $E > \frac{d+1}{2}$ , the set

$$\{(|x^1 - x^2|, ..., |x^{k-1} - x^k|) : x^i \in E\}$$

has non-empty interior.

## Distance trees

#### This result was later generalized from chains to trees.

Theorem (losevich-Taylor, 2019)

Let  $d, k \ge 2$  and let  $E \subset \mathbb{R}^d$  be compact. Let T be a tree on the vertices  $\{1, ..., k\}$  with edge set  $\mathcal{E}$ . If dim  $E > \frac{d+1}{2}$ , the set

$$\{(|x^i - x^j|)_{(i,j) \in \mathcal{E}} : x^i \in E\}$$

has non-empty interior.

This result was later generalized from chains to trees.

Theorem (Iosevich-Taylor, 2019)

Let  $d, k \ge 2$  and let  $E \subset \mathbb{R}^d$  be compact. Let T be a tree on the vertices  $\{1, ..., k\}$  with edge set  $\mathcal{E}$ . If dim  $E > \frac{d+1}{2}$ , the set

$$\{(|x^i - x^j|)_{(i,j) \in \mathcal{E}} : x^i \in E\}$$

has non-empty interior.

For both chains and trees, the threshold does not depend on k.

## Volume chains

Our second result is an analogue for hypergraph chains of volumes.

#### Theorem (Galo-M., 2021)

Let  $k, d \ge 2$  and let  $E \subset \mathbb{R}^d$  be compact. If dim  $E > d - 1 + \frac{1}{d}$ , then
