Optimal Transport and Point Distributions on the Torus

Stefan Steinerberger

Point Distribution Webinar, September 2020

UNIVERSITY of WASHINGTON

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Here's a classical problem: how do distribute sequences of points in the most regular way in $[0, 1]^d$?

Here's a classical problem: how do distribute sequences of points in the most regular way in $[0, 1]^d$? Or how do we distribute sets of points most regularly?

Here's a classical problem: how do distribute sequences of points in the most regular way in $[0, 1]^d$? Or how do we distribute sets of points most regularly?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

There are many different ways of measuring this regularity. Certainly a very popular one is **discrepancy**.

Here's a classical problem: how do distribute sequences of points in the most regular way in $[0, 1]^d$? Or how do we distribute sets of points most regularly?

There are many different ways of measuring this regularity. Certainly a very popular one is **discrepancy**. It is (1) geometrically meaningful and (2) connected to practical applications via the Koksma-Hlawka inequality

$$\left|\int_{[0,1]^d} f(x) dx - rac{1}{N} \sum_{k=1}^N f(x_k)
ight| \leq D_N(\mathbf{x}) \cdot \operatorname{Var}(f),$$

Here's a classical problem: how do distribute sequences of points in the most regular way in $[0, 1]^d$? Or how do we distribute sets of points most regularly?

There are many different ways of measuring this regularity. Certainly a very popular one is **discrepancy**. It is (1) geometrically meaningful and (2) connected to practical applications via the Koksma-Hlawka inequality

$$\left|\int_{[0,1]^d} f(x) dx - rac{1}{N} \sum_{k=1}^N f(x_k)
ight| \leq D_N(\mathbf{x}) \cdot \operatorname{Var}(f),$$

where D_N is the discrepancy and Var denotes Hardy-Krause variation.

Here's a classical problem: how do distribute sequences of points in the most regular way in $[0, 1]^d$? Or how do we distribute sets of points most regularly?

There are many different ways of measuring this regularity. Certainly a very popular one is **discrepancy**. It is (1) geometrically meaningful and (2) connected to practical applications via the Koksma-Hlawka inequality

$$\left|\int_{[0,1]^d} f(x) dx - rac{1}{N} \sum_{k=1}^N f(x_k)
ight| \leq D_N(\mathbf{x}) \cdot \operatorname{Var}(f),$$

where D_N is the discrepancy and Var denotes Hardy-Krause variation. Hardy-Krause is tricky: it tends to grow exponentially in the dimension.

The point of this talk is to discuss a new type of notion. I propose we look at something called the Wasserstein distance

$$W_1 = W_1\left(\frac{1}{N}\sum_{k=1}^N \delta_{x_k}, dx\right)$$

as a measure of regularity.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

It is (1) geometrically meaningful and (2) connected to practical applications via what is known as the Kantorovich-Rubinstein duality

$$\left|\int_{[0,1]^d} f(x)dx - \frac{1}{N}\sum_{k=1}^N f(x_k)\right| \leq W_1 \cdot \|\nabla f\|_{L^\infty}.$$

Moreover, this inequality is sharp. $\|\nabla f\|_{L^{\infty}}$ is, I would argue, a lot more natural than Hardy-Krause.

$$D_N \sim rac{(\log N)^{d-1}}{N}.$$

$$D_N \sim rac{(\log N)^{d-1}}{N}.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

This function is actually increasing until $N \sim e^d$. Moreover, Hardy-Krause variation also tends to grow quite quickly.

$$D_N \sim rac{(\log N)^{d-1}}{N}.$$

This function is actually increasing until $N \sim e^d$. Moreover, Hardy-Krause variation also tends to grow quite quickly.

$$\left|\int_{[0,1]^d} f(x) dx - \frac{1}{N} \sum_{k=1}^N \delta_{x_k}\right| \le D_N(\mathbf{x}) \cdot \operatorname{Var}(f)$$

is not really useful until $N \gg d^d$.

$$D_N \sim rac{(\log N)^{d-1}}{N}.$$

This function is actually increasing until $N \sim e^d$. Moreover, Hardy-Krause variation also tends to grow quite quickly.

$$\left|\int_{[0,1]^d} f(x) dx - \frac{1}{N} \sum_{k=1}^N \delta_{x_k}\right| \le D_N(\mathbf{x}) \cdot \operatorname{Var}(f)$$

is not really useful until $N \gg d^d$. In contrast,

$$\left|\int_{[0,1]^d} f(x) dx - \frac{1}{N} \sum_{k=1}^N \delta_{x_k}\right| \le W_1 \cdot \|\nabla f\|_{L^{\infty}}$$

has no such hidden costs. The price: $W_1 \gtrsim N^{-1/d}$.

USSR

Leonid Vital'yevich KANTOROVICH

Head, Problems Laboratory of Economic-Mathematical Methods and Operations Research, Institute of Management of the National Economy

An internationally recognized creative genius in the fields of mathematics and the application of electronic computers to economic affairs, Academician Leonid Kantorovich (pronounced kahntuhROHvich) has worked at the Institute of Management of the National Economy since 1971. He has been involved in advanced mathematical research since the age of 15; in 1939 he invented

(1975)

linear programming, one of the most significant contributions to economic management in the twentieth century. Kantorovich has spent most of his adult life battling to win acceptance for his revolutionary concept from Soviet

Suppose we are given two measure μ and ν having same total mass and want to transport one to the other. (In all our applications, μ will be the measure induced by the points and $\nu = dx$.)

Suppose we are given two measure μ and ν having same total mass and want to transport one to the other. (In all our applications, μ will be the measure induced by the points and $\nu = dx$.)

Think of both measures as being a collection of little boxes. Suppose it costs $\delta \cdot \varepsilon$ to move a box of weight ε distance δ . What is the cheapest way to move the boxes to the desired goal?

 $0, 1, 1, 4, 4, 5, 5, 6, 6, 7, 7, 9, 9, 13, 13, \ldots$

$$W_{p}\left(\frac{1}{29}\sum_{k=0}^{28}\delta_{\frac{k^{2} \mod 29}{29}}, dx\right) \leq ?$$

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = 差 = のへで

 $0, 1, 1, 4, 4, 5, 5, 6, 6, 7, 7, 9, 9, 13, 13, \ldots$

$$W_{p}\left(\frac{1}{29}\sum_{k=0}^{28}\delta_{\frac{k^{2} \mod 29}{29}}, dx\right) \leq ?$$

Theorem (S. 2018) For primes p

$$W_2\left(rac{1}{p}\sum_{k=0}^{p-1}\delta_{rac{k^2 \mod p}{p}}, dx
ight)\lesssim rac{1}{\sqrt{p}}$$

 $0, 1, 1, 4, 4, 5, 5, 6, 6, 7, 7, 9, 9, 13, 13, \ldots$

$$W_{p}\left(\frac{1}{29}\sum_{k=0}^{28}\delta_{\frac{k^{2} \mod 29}{29}}, dx\right) \leq ?$$

Theorem (S. 2018) For primes p

$$W_2\left(rac{1}{
ho}\sum_{k=0}^{p-1}\delta_{rac{k^2 \mod p}{p}}, \ dx
ight)\lesssim rac{1}{\sqrt{
ho}}$$

This tells us that we have to move most particles roughly distance $\sim p^{-1/2}$. This is in line with the heuristic that these are 'random'.

The Quadratic Residues in \mathbb{F}_p Theorem (S. 2018) For primes p

$$W_2\left(rac{1}{p}\sum_{k=0}^{p-1}\delta_{rac{k^2 \mod p}{p}}, dx
ight)\lesssim rac{1}{\sqrt{p}}$$

It is natural to compare this to the discrepancy

$$\operatorname{disc} = \sup_{0 < a < b < 1} \left| \frac{\# \left\{ 0 \le i \le p - 1 : a \le \frac{i^2 \mod p}{p} \le b \right\}}{p} - (b - a) \right|$$

The Quadratic Residues in \mathbb{F}_p Theorem (S. 2018) For primes p

$$W_2\left(rac{1}{p}\sum_{k=0}^{p-1}\delta_{rac{k^2 \mod p}{p}}, \ dx
ight)\lesssim rac{1}{\sqrt{p}}$$

It is natural to compare this to the discrepancy

$$\operatorname{disc} = \sup_{0 < a < b < 1} \left| \frac{\# \left\{ 0 \le i \le p - 1 : a \le \frac{i^2 \mod p}{p} \le b \right\}}{p} - (b - a) \right|$$

Theorem

$$disc \lesssim \frac{\log p}{\sqrt{p}} \qquad (Polya-Vinogradov)$$
$$disc \lesssim \frac{\log \log p}{\sqrt{p}} \qquad (Vaughan-Montgomery (GRH))$$

The Quadratic Residues in \mathbb{F}_p

Theorem (Cole Graham 2020) For primes p and $2 < q < \infty$

$$W_q\left(rac{1}{p}\sum_{k=0}^{p-1}\delta_{rac{k^2 \mod p}{p}}
ight)\lesssimrac{1}{\sqrt{p}}$$

The Quadratic Residues in \mathbb{F}_p

Theorem (Cole Graham 2020) For primes p and $2 < q < \infty$

$$W_q\left(rac{1}{p}\sum_{k=0}^{p-1}\delta_{rac{k^2 \mod p}{p}}
ight)\lesssimrac{1}{\sqrt{p}}$$

He also pointed out that

$$W_2\left(\frac{1}{p}\sum_{k=0}^{p-1}\delta_{\frac{k^2 \mod p}{p}}\right) \ge \frac{1}{\sqrt{12p}}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

which shows that this result is sharp.

Irrational Rotations: Kronecker sequences Theorem (S 2018)

$$W_2\left(rac{1}{N}\sum_{n=1}^N\delta_{\sqrt{2}\cdot n \mod 1}, \ dx
ight)\lesssim rac{\sqrt{\log N}}{N}$$

How to place your coffee shops?

Question. Is there a sequence $(x_n)_{n=1}^{\infty}$ on $[0,1]^2$ such that

$$W_2\left(rac{1}{N}\sum_{k=1}^N\delta_{x_k},dx
ight)\lesssim N^{-1/2}$$
 ?

(Recall, Cole Graham: on [0,1], no sequence has $\lesssim N^{-1}$.)

The Coffee Shop Problem

Theorem (Louis Brown and S, 2019) Let $d \ge 2$ and let $\alpha \in \mathbb{R}^d$ be badly approximable. Then the Kronecker sequence $x_k = k\alpha \mod 1$ satisfies

$$W_2\left(rac{1}{N}\sum_{k=1}^N\delta_{x_k},dx
ight)\lesssim_{c_{lpha},d}N^{-1/d}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

The Coffee Shop Problem

Theorem (Louis Brown and S, 2019) Let $d \ge 2$ and let $\alpha \in \mathbb{R}^d$ be badly approximable. Then the Kronecker sequence $x_k = k\alpha \mod 1$ satisfies

$$W_2\left(rac{1}{N}\sum_{k=1}^N\delta_{\mathbf{x}_k},d\mathbf{x}
ight)\lesssim_{c_{\alpha},d}N^{-1/d}$$

In $d \ge 3$, this seems to be fairly easy to do. **Open Problem.** But d = 2 appears subtle, are there other constructions?

Something Quite Nice

How does one get good estimates on

$$W_2\left(\frac{1}{N}\sum_{n=1}^N\delta_{x_k},dx\right)\lesssim?$$

Something Quite Nice

How does one get good estimates on

$$W_2\left(rac{1}{N}\sum_{n=1}^N\delta_{x_k},dx
ight)\lesssim?$$

Peyre's estimate works but Dirac measures are no longer in \dot{H}^{-1} .

Something Quite Nice

How does one get good estimates on

$$W_2\left(rac{1}{N}\sum_{n=1}^N\delta_{x_k},dx
ight)\lesssim?$$

Peyre's estimate works but Dirac measures are no longer in \dot{H}^{-1} .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

This has an interesting analogue in Analytic Number Theory: **Zinterhof's Diaphony**.
Something Quite Nice

How does one get good estimates on

$$W_2\left(rac{1}{N}\sum_{n=1}^N\delta_{x_k},dx
ight)\lesssim?$$

Peyre's estimate works but Dirac measures are no longer in \dot{H}^{-1} .

This has an interesting analogue in Analytic Number Theory: **Zinterhof's Diaphony**. For $\{x_1, \ldots, x_N\} \subset [0, 1]$, Zinterhof's diaphony F_N is given by

$$F_{N} = \left(\sum_{\ell \neq 0} \frac{1}{\ell^{2}} \left| \frac{1}{N} \sum_{k=1}^{N} e^{2\pi i \ell x_{l}} \right|^{2} \right)^{1/2}$$

It has never been generalized to higher dimensions.

Again Exponential Sums!

How does one get good estimates on

$$W_2\left(\frac{1}{N}\sum_{n=1}^N\delta_{x_k},dx
ight)\lesssim?$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Again Exponential Sums!

How does one get good estimates on

$$W_2\left(\frac{1}{N}\sum_{n=1}^N\delta_{x_k},dx\right)\lesssim?$$

We use the triangle inequality

$$W_2(\mu, dx) \leq W_2(\mu, \mu_{ ext{nice}}) + W_2(\mu_{ ext{nice}}, dx).$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Again Exponential Sums!

How does one get good estimates on

$$W_2\left(\frac{1}{N}\sum_{n=1}^N\delta_{x_k},dx\right)\lesssim?$$

We use the triangle inequality

$$W_2\left(\mu, \mathit{d} x
ight) \leq W_2\left(\mu, \mu_{\mathsf{nice}}
ight) + W_2(\mu_{\mathsf{nice}}, \mathit{d} x).$$

Theorem (Louis Brown and S, 2019) For each t > 0,

$$W_2(\mu, dx)^2 \lesssim_d \inf_{t>0} \left[t + \sum_{k \in \mathbb{Z}^d \atop k \neq 0} \frac{e^{-\|k\|^2 t}}{\|k\|^2} \left| \frac{1}{N} \sum_{n=1}^N e^{2\pi i \langle k, x_n \rangle} \right|^2 \right]$$

I think it could be interesting to revisit classical objects! What about

- the Halton sequence?
- the Hammersley set?
- Sobol?

Surely many of these objects satisfy

$$W_2\left(\frac{1}{N}\sum_{n=1}^N \delta_{x_k}, dx\right) \lesssim N^{-1/d}$$
?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

I think it could be interesting to revisit classical objects! What about

- the Halton sequence?
- the Hammersley set?
- Sobol?

Surely many of these objects satisfy

$$W_2\left(rac{1}{N}\sum_{n=1}^N\delta_{x_k},dx
ight)\lesssim N^{-1/d}?$$

Some of them can probably be attacked via Exponential Sums? Others (nets?) via explicit constructions? I think it could be interesting to revisit classical objects!

We recall that

$$\left|\int_{[0,1]^d} f(x) dx - \frac{1}{N} \sum_{k=1}^N f(x_k)\right| \leq W_1\left(\frac{1}{N} \sum_{n=1}^N \delta_{x_k}, dx\right) \cdot \|\nabla f\|_{L^{\infty}}.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

What if the function is twice-differentiable? Or in other smoothness classes?

This is another classical problem: it is known that

$$D_N \lesssim rac{(\log N)^{d-1}}{N}$$

and the implicit constants are your enemy.

This is another classical problem: it is known that

$$D_N \lesssim rac{(\log N)^{d-1}}{N}$$

and the implicit constants are your enemy.

Theorem (Heinrich, Novak, Wasilkowski, Wozniakowski, 2001) There exist $\{x_1, \ldots, x_N\} \subset [0, 1]^d$ such that

$$D_N \leq c \sqrt{\frac{d}{N}}$$

$$\left|\int_{[0,1]^d} f(x) dx - \frac{1}{N} \sum_{k=1}^N f(x_k)\right| \le c_d \|\nabla f\|_{L^{\infty}(\mathbb{T}^d)}^{(d-1)/d} \|\nabla f\|_{L^1(\mathbb{T}^d)}^{1/d} N^{-1/d}.$$

This is sharp again (probably?): take $0 < \varepsilon \ll 1$ and

$$f(x) = \min \left\{ \varepsilon, \min_{1 \le i \le N} \|x - x_i\| \right\}.$$

On Friday

One big issue with classical discrepancy is that it is adapted to the torus \mathbb{T}^d (since we use axis-parallel rectangles). There are natural variations on the sphere (take spherical caps) but it's not clear what to do on a general manifold.

In contrast, the Wasserstein distance does not care very much about the underlying background. This makes it a **stable** notion.
