Problem Statement

Optimization on Manifolds with Structure:

$$\min_{x \in \mathcal{M}} F(x) = f(x) + h(x),$$

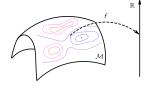

- ullet $\mathcal M$ is a finite-dimensional Riemannian manifold;
- f is smooth and may be nonconvex; and
- h(x) is continuous and convex but may be nonsmooth;

Problem Statement

Optimization on Manifolds with Structure:

$$\min_{x \in \mathcal{M}} F(x) = f(x) + h(x),$$

- ullet $\mathcal M$ is a finite-dimensional Riemannian manifold;
- f is smooth and may be nonconvex; and
- h(x) is continuous and convex but may be nonsmooth;

Applications: sparse PCA [ZHT06], compressed model [OLCO13], sparse partial least squares regression [CSG $^+$ 18], sparse inverse covariance estimation [BESS19], sparse blind deconvolution [ZLK $^+$ 17], and clustering [HWGVD22].

Existing Nonsmooth Optimization on Manifolds

$F: \mathcal{M} \to \mathbb{R}$ is Lipschitz continuous

- Huang (2013), Gradient sampling method without convergence analysis.
- Grohs and Hosseini (2015), Two ϵ -subgradient-based optimization methods using line search strategy and trust region strategy, respectively. Any limit point is a critical point.
- Hosseini and Uschmajew (2017), Gradient sampling method and any limit point is a critical point.
- Hosseini, Huang, and Yousefpour (2018), Merge ϵ -subgradient-based and quasi-Newton ideas and show any limit point is a critical point.

Existing Nonsmooth Optimization on Manifolds

$F: \mathcal{M} \to \mathbb{R}$ is convex

- Zhang and Sra (2016), subgradient-based method and function value converges to the optimal $O(1/\sqrt{k})$.
- Ferreira and Oliveira (2002) proximal point method, convergence using convexity

 Bento, da Cruz Neto and Oliveira (2011), convergence using Kurdyka-Łojasiewicz (KL); and

 Bento, Ferreira, and Melo (2017), function value converges to the optimal O(1/k) on Hadamard manifold using convexity

Existing Nonsmooth Optimization on Manifolds

F = f + g, where f is L-con, and g is non-smooth

- Chen, Ma, So, and Zhang (2018), A proximal gradient method with global convergence
- Xiao, Liu, and Yuan (2021), Infeasible approach over the Stiefel manifold
- Zhou, Bao, and Ding (2022), An augmented Lagrangian method on matrix manifolds
- Huang and Wei (2021-2023), A Riemannian proximal gradient method, an inexact Riemannian proximal gradient method, and a modified FISTA on embedded manifolds
- Wang and Yang (2023), A proximal quasi-Newton method on manifolds on the Stiefel manifold
- Huang, Meng, Gallivan, and Van Dooren (2023), An inexact proximal gradient method on embedded submanifolds
- Beck and Rosset (2023), A dynamic smoothing technique

Outline

Optimization with Structure:

- *L*: greater than the Lipschitz constant of ∇f ;
- Proximal mapping: easy to compute;
- Any limit point is a critical point;
- $O\left(\frac{1}{k}\right)$ sublinear convergence rate for convex f and h;
- Linear convergence rate for strongly convex f and convex h;

$$\min_{x \in \mathbb{R}^n} F(x) = f(x) + h(x).$$

$$\begin{cases} d_k = \arg\min_{p \in \mathbb{R}^n} \left\langle \nabla f(x_k), p \right\rangle + \frac{L}{2} \|p\|_F^2 + h(x_k + p), & \text{(Proximal mapping)} \\ x_{k+1} = x_k + d_k. & \text{(Update iterates)} \end{cases}$$

- h = 0: reduce to steepest descent method;
- L: greater than the Lipschitz constant of ∇f ;
- Proximal mapping: easy to compute;
- Any limit point is a critical point;
- $O\left(\frac{1}{k}\right)$ sublinear convergence rate for convex f and h;
- Linear convergence rate for strongly convex f and convex h;
- Local convergence rate by KL property;

Riemannian versions

Optimization with Structure: \mathcal{M}

$$\min_{x \in \mathcal{M}} F(x) = f(x) + h(x).$$

Riemannian versions

Optimization with Structure: M

$$\min_{x \in \mathcal{M}} F(x) = f(x) + h(x).$$

Euclidean proximal mapping

$$d_k = \arg\min_{p \in \mathbb{R}^n} \langle \nabla f(x_k), p \rangle + \frac{L}{2} ||p||_F^2 + h(x_k + p)$$

In the Riemannian setting:

- How to define the proximal mapping?
- Can be solved cheaply?
- Share the same convergence rate?

Riemannian version in [CMSZ20]

A Riemannian proximal mapping [CMSZ20]

Only works for embedded submanifold;

Riemannian version in [CMSZ20]

Riemannian version in [HW21a]

GOAL: Develop a Riemannian proximal gradient method with convergence rate analysis and good numerical performance for some instances

A Riemannian Proximal Gradient Method (RPG)

Let
$$\ell_{x_k}(\eta) = \underbrace{\langle \nabla f(x_k), \eta \rangle_{x_k} + \frac{L}{2} \|\eta\|_{x_k}^2}_{\text{Riemannian metric}} + h(\underbrace{R_{x_k}(\eta)}_{\text{replace } x_k + \eta});$$

- **1** $\eta_k \in T_{x_k} \mathcal{M}$ is a stationary point of $\ell_{x_k}(\eta)$, and $\ell_{x_k}(0) \geq \ell_k(\eta_k)$;
- - General framework for Riemannian optimization;
 - Step size can be fixed to be 1;
- Convergence rate results;

Riemannian version in [HW21a]

Assumption:

• The function F is bounded from below and the sublevel set $\Omega_{x_0} = \{x \in \mathcal{M} \mid F(x) \leq F(x_0)\}$ is compact;

This assumption hold if, for example, F is continuous and $\mathcal M$ is compact.

$$\min_{X \in \operatorname{St}(\rho, n)} - \operatorname{trace}(X^T A^T A X) + \lambda ||X||_1,$$

Riemannian version in [HW21a]

Assumption:

- The function F is bounded from below and the sublevel set $\Omega_{x_0} = \{x \in \mathcal{M} \mid F(x) \leq F(x_0)\}$ is compact;
- **②** The function f is L-retraction-smooth with respect to the retraction R in the sublevel set Ω_{x_0} .

Definition

A function $h: \mathcal{M} \to \mathbb{R}$ is called L-retraction-smooth with respect to a retraction R in $\mathcal{N} \subseteq \mathcal{M}$ if for any $x \in \mathcal{N}$ and any $\mathcal{S}_x \subseteq \mathrm{T}_x \mathcal{M}$ such that $R_x(\mathcal{S}_x) \subseteq \mathcal{N}$, we have that

$$h(R_x(\eta)) \le h(x) + \langle \operatorname{grad} h(x), \eta \rangle_x + \frac{L}{2} \|\eta\|_x^2, \quad \forall \eta \in \mathcal{S}_x.$$

Riemannian version in [HW21a]

Assumption:

- The function F is bounded from below and the sublevel set $\Omega_{x_0} = \{x \in \mathcal{M} \mid F(x) \leq F(x_0)\}$ is compact;
- **②** The function f is L-retraction-smooth with respect to the retraction R in the sublevel set Ω_{x_0} .

If the following conditions hold, then f is L-retraction-smooth with respect to the retraction R in the manifold \mathcal{M} [BAC18, Lemma 2.7]

- \mathcal{M} is a compact Riemannian submanifold of a Euclidean space \mathbb{R}^n ;
- the retraction *R* is globally defined;
- $f: \mathbb{R}^n \to \mathbb{R}$ is *L*-smooth in the convex hull of \mathcal{M} ;

$$\min_{X \in \operatorname{St}(p,n)} - \operatorname{trace}(X^T A^T A X) + \lambda \|X\|_1,$$

Riemannian version in [HW21a]

Assumption:

- The function F is bounded from below and the sublevel set $\Omega_{x_0} = \{x \in \mathcal{M} \mid F(x) \leq F(x_0)\}$ is compact;
- ② The function f is L-retraction-smooth with respect to the retraction R in the sublevel set Ω_{x_0} .

Theoretical results:

• For any accumulation point x_* of $\{x_k\}$, x_* is a stationary point, i.e., $0 \in \partial F(x_*)$.

Riemannian version in [HW21a]

Additional Assumptions:

• f and g are retraction-convex in $\Omega \supseteq \Omega_{x_0}$;

Definition

A function $h: \mathcal{M} \to \mathbb{R}$ is called retraction-convex with respect to a retraction R in $\mathcal{N} \subseteq \mathcal{M}$ if for any $x \in \mathcal{N}$ and any $\mathcal{S}_x \subseteq \mathrm{T}_x \, \mathcal{M}$ such that $R_x(\mathcal{S}_x) \subseteq \mathcal{N}$, there exists a tangent vector $\zeta \in \mathrm{T}_x \, \mathcal{M}$ such that $q_x = h \circ R_x$ satisfies

$$q_x(\eta) \ge q_x(\xi) + \langle \zeta, \eta - \xi \rangle_x \ \forall \eta, \xi \in \mathcal{S}_x.$$
 (1)

Note that $\zeta = \operatorname{grad} q_x(\xi)$ if h is differentiable; otherwise, ζ is any subgradient of q_x at ξ .

Riemannian version in [HW21a]

Additional Assumptions:

• f and g are retraction-convex in $\Omega \supseteq \Omega_{x_0}$;

Lemma

Given $x \in \mathcal{M}$ and a twice continuously differentiable function $h : \mathcal{M} \to \mathbb{R}$, if one of the following conditions holds:

- Hess h is positive definite at x, and the retraction is second order;
- The manifold \mathcal{M} is an embedded submanifold of \mathbb{R}^n endowed with the Euclidean metric; \mathcal{W} is an open subset of \mathbb{R}^n ; $x \in \mathcal{W}$;
 - $h: \mathcal{W} \subset \mathbb{R}^n \to \mathbb{R}$ is a μ -strongly convex function in the Euclidean setting for a sufficient large μ ; the retraction is second order;

then there exists a neighborhood of x, denoted by \mathcal{N}_x , such that the function $h: \mathcal{M} \to \mathbb{R}$ is retraction-convex in \mathcal{N}_x .

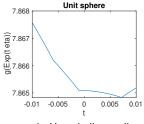

Riemannian version in [HW21a]

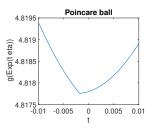

Additional Assumptions:

• f and g are retraction-convex in $\Omega \supseteq \Omega_{x_0}$;

Nonsmooth? Example: $h(x) = ||x||_1$ with exponential mapping

- unit sphere: $\{x \in \mathbb{R}^n \mid x^T x = 1\}, n = 100$
- Poincaré ball model [GBH18]: $\{x \in \mathbb{R}^n \mid x^T x < 1\}$, n = 100
- $h(\operatorname{Exp}_{\mathsf{x}}(t\eta_{\mathsf{x}}))$ versus t

[GBH18] Ganea et al., Hyperbolic entailment cones for learning hierarchical embedding, ICML, 2018.

Riemannian version in [HW21a]

Additional Assumptions:

- f and g are retraction-convex in $\Omega \supseteq \Omega_{x_0}$;
- Retraction approximately satisfies the triangle relation in Ω : for all $x,y,z\in\Omega$,

$$\left|\left\|\xi_{x}-\eta_{x}\right\|_{x}^{2}-\left\|\zeta_{y}\right\|_{y}^{2}\right|\leq\kappa\left\|\eta_{x}\right\|_{x}^{2},\text{ for a constant }\kappa$$

where
$$\eta_x = R_x^{-1}(y)$$
, $\xi_x = R_x^{-1}(z)$, $\zeta_y = R_y^{-1}(z)$.

• In the Euclidean setting: $\eta_x = R_x^{-1}(y) = y - x$, $\xi_x = R_x^{-1}(z) = z - x$, $\zeta_y = R_y^{-1}(z) = z - y$:

$$\xi_x - \eta_x = (z - x) - (y - x) = z - y = \zeta_y.$$

ullet Holds for compact set $\overline{\Omega}$ with the exponential mapping;

Riemannian version in [HW21a]

Additional Assumptions:

- f and g are retraction-convex in $\Omega \supseteq \Omega_{x_0}$;
- Retraction approximately satisfies the triangle relation in Ω : for all $x,y,z\in\Omega$,

$$\left| \|\xi_x - \eta_x\|_x^2 - \|\zeta_y\|_y^2 \right| \le \kappa \|\eta_x\|_x^2, \text{ for a constant } \kappa$$

where
$$\eta_x = R_x^{-1}(y)$$
, $\xi_x = R_x^{-1}(z)$, $\zeta_y = R_y^{-1}(z)$.

Theoretical results:

• Convergence rate O(1/k):

$$F(x_k) - F(x_*) \leq \frac{1}{k} \left(\frac{L}{2} \|R_{x_0}^{-1}(x_*)\|_{x_0}^2 + \frac{L\kappa C}{2} (F(x_0) - F(x_*)) \right).$$

Riemannian version in [HW21a]

Assumption:

Assumptions for the global convergence

- The function F is bounded from below and the sublevel set $\Omega_{x_0} = \{x \in \mathcal{M} \mid F(x) \leq F(x_0)\}$ is compact;
- **②** The function f is L-retraction-smooth with respect to the retraction R in the sublevel set Ω_{x_0} .

$$\min_{X \in \operatorname{St}(p,n)} - \operatorname{trace}(X^T A^T A X) + \lambda ||X||_1,$$

Riemannian version in [HW21a]

Assumption:

- 4 Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable

Definition ([AMS08, 7.4.3])

A function f on \mathcal{M} is Lipschitz continuously differentiable if it is differentiable and if there exists β_1 such that, for all x,y in \mathcal{M} with $\operatorname{dist}(x,y) < i(\mathcal{M})$, it holds that

$$\|\mathcal{P}_{\gamma}^{0\leftarrow 1}\operatorname{grad} f(y)-\operatorname{grad} f(x)\|_{x}\leq \beta_{1}\operatorname{dist}(x,y),$$

where γ is the unique minimizing geodesic with $\gamma(0) = x$ and $\gamma(1) = y$.

Riemannian version in [HW21a]

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable

If f is smooth and the manifold \mathcal{M} is compact, then the function f is Lipschitz continuously differentiable. [AMS08, Proposition 7.4.5 and Corollary 7.4.6].

$$\min_{X \in \operatorname{St}(\rho, n)} - \operatorname{trace}(X^T A^T A X) + \lambda ||X||_1,$$

Riemannian version in [HW21a]

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property [BdCNO11]

Definition

A continuous function $f:\mathcal{M}\to\mathbb{R}$ is said to have the Riemannian KL property at $x\in\mathcal{M}$ if and only if there exists $\varepsilon\in(0,\infty]$, a neighborhood $U\subset\mathcal{M}$ of x, and a continuous concave function $\varsigma:[0,\varepsilon]\to[0,\infty)$ such that

- $\varsigma(0) = 0$, ς is C^1 on $(0, \varepsilon)$, and $\varsigma' > 0$ on $(0, \eta)$,
- For every $y \in U$ with $f(x) < f(y) < f(x) + \varepsilon$, we have

$$\varsigma'(f(y) - f(x)) \operatorname{dist}(0, \partial f(y)) \ge 1,$$

where $\operatorname{dist}(0,\partial f(y))=\inf\{\|v\|_y:v\in\partial f(y)\}$ and ∂ denotes the Riemannian generalized subdifferential. The function ς is called the desingularising function.

Riemannian version in [HW21a]

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property [BdCNO11]

Theoretical results:

it holds that

$$\sum_{k=0}^{\infty} \operatorname{dist}(x_k, x_{k+1}) < \infty.$$

Therefore, there exists only a unique accumulation point.

Riemannian version in [HW21a]

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property [BdCNO11]

Theoretical results:

- If the desingularising function has the form $\varsigma(t)=\frac{C}{\theta}\,t^{\theta}$ for C>0 and $\theta\in(0,1]$ for all $x\in\Omega_{x_0}$, then
 - if $\theta=1$, then the Riemannian proximal gradient method terminates in finite steps;
 - if $\theta \in [0.5, 1)$, then $||x_k x_*|| < C_1 d^k$ for $C_1 > 0$ and $d \in (0, 1)$;
 - if $\theta \in (0, 0.5)$, then $||x_k x_*|| < C_2 k^{\frac{-1}{1-2\theta}}$ for $C_2 > 0$;

Numerical experiments

Sparse PCA problem

$$\min_{X \in \mathrm{St}(p,n)} - \mathrm{trace}(X^T A^T A X) + \lambda ||X||_1,$$

where $A \in \mathbb{R}^{m \times n}$ is a data matrix.

Numerical experiments

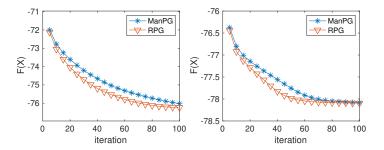

Figure: Two typical runs of ManPG, RPG, A-ManPG, and A-RPG for the Sparse PCA problem. $n=1024,\ p=4,\ \lambda=2,\ m=20.$

Outline

Optimization with Structure:

$$\min_{x \in \mathcal{M}} F(x) = f(x) + h(x).$$

- Proximal gradient methods
- Inexact proximal gradient methods
 - Inexact version of RPG [HW21a]
 - Inexact version of ManPG [HWGVD22]
- A proximal Newton method

Both ManPG and RPG require the Riemannian proximal mapping to be solved exactly

- Theoretically, but not practical numerically
- Can we relax this requirement and still preserve desired convergence properties?
- Inexact RPG
- Inexact ManPG

Inexact RPG (IRPG)

Let
$$\ell_{\mathsf{x}_k}(\eta) = \langle \operatorname{grad} f(\mathsf{x}_k), \eta \rangle_{\mathsf{x}_k} + \frac{\tilde{\ell}}{2} \|\eta\|_{\mathsf{x}_k}^2 + h(R_{\mathsf{x}_k}(\eta));$$

ullet Find $\hat{\eta}_k \in \mathrm{T}_{\mathsf{x}}\,\mathcal{M}$ such that

$$\|\hat{\eta}_{x_k} - \eta_{x_k}^*\| \leq q(\varepsilon_k, \|\hat{\eta}_{x_k}\|) \text{ and } \ell_{x_k}(0) \geq \ell_{x_k}(\hat{\eta}_{x_k}),$$

where $\varepsilon_k > 0$, and $q : \mathbb{R}^2 \to \mathbb{R}$ is a continuous function;

Inexact RPG (IRPG)

Let
$$\ell_{\mathsf{x}_k}(\eta) = \langle \operatorname{grad} f(\mathsf{x}_k), \eta \rangle_{\mathsf{x}_k} + \frac{\tilde{L}}{2} \|\eta\|_{\mathsf{x}_k}^2 + h(R_{\mathsf{x}_k}(\eta));$$

• Find $\hat{\eta}_k \in T_x \mathcal{M}$ such that

$$\|\hat{\eta}_{x_k} - \eta_{x_k}^*\| \le q(\varepsilon_k, \|\hat{\eta}_{x_k}\|) \text{ and } \ell_{x_k}(0) \ge \ell_{x_k}(\hat{\eta}_{x_k}),$$

where $\varepsilon_k > 0$, and $q : \mathbb{R}^2 \to \mathbb{R}$ is a continuous function;

Four choices of q lead to different convergence results:

- 1) Global $q(\varepsilon_k, ||\hat{\eta}_{x_k}||) = \varepsilon_k$ with $\varepsilon_k \to 0$;
- 2) Global $q(\varepsilon_k, \|\hat{\eta}_{x_k}\|) = \tilde{q}(\|\hat{\eta}_{x_k}\|)$ with $\tilde{q}: \mathbb{R} \to [0, \infty)$ a continuous function satisfying $\tilde{q}(0) = 0$;
- 3) Unique $q(\varepsilon_k, ||\hat{\eta}_{x_k}||) = \varepsilon_k^2$, with $\sum_{k=0}^{\infty} \varepsilon_k < \infty$; and
- 4) Rate $q(\varepsilon_k, \|\hat{\eta}_{x_k}\|) = \min(\varepsilon_k^2, \delta_q \|\hat{\eta}_{x_k}\|^2)$ with a constant $\delta_q > 0$ and $\sum_{k=0}^{\infty} \varepsilon_k < \infty$.

Inexact RPG (IRPG)

Let

- Algorithms based on strong convexity of the Euclidean proximal mapping
- Riemannian: may not be convex

$$\ell_{x_k}(\eta) = \langle \operatorname{grad} f(x_k), \eta \rangle_{x_k} + \frac{L}{2} \|\eta\|_{x_k}^2 + h(R_{x_k}(\eta))$$

Inexact RPG

Assumption (same as the RPG):

- The function F is bounded from below and the sublevel set $\Omega_{x_0} = \{x \in \mathcal{M} \mid F(x) \leq F(x_0)\}$ is compact;
- **②** The function f is L-retraction-smooth with respect to the retraction R in the sublevel set Ω_{x_0} .

Theoretical results:

• Suppose $\lim_{k\to\infty} q(\varepsilon_k, \|\hat{\eta}_{x_k}\|) = 0$, then for any accumulation point x_* of $\{x_k\}$, x_* is a stationary point, i.e., $0 \in \partial F(x_*)$.

Inexact RPG

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property

Inexact RPG

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property
- lacktriangledown F is locally Lipschitz continuous with respect to the retraction R

Definition

A function $h: \mathcal{M} \to \mathbb{R}$ is called locally Lipschitz continuous with respect to a retraction R if for any compact subset \mathcal{N} of \mathcal{M} , there exists a constant L_h such that for any $x \in \mathcal{N}$ and $\xi_x, \eta_x \in \mathrm{T}_x \, \mathcal{M}$ satisfying $R_x(\xi_x) \in \mathcal{N}$ and $R_x(\eta_x) \in \mathcal{N}$, it holds that $|h \circ R(\xi_x) - h \circ R(\eta_x)| \leq L_h \|\xi_x - \eta_x\|$.

Inexact RPG

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property
- F is locally Lipschitz continuous with respect to the retraction R

If the manifold $\mathcal M$ is an embedded submanifold and function F is locally Lipschitz in the embedding space, then the function is locally Lipschitz continuous with respect to any global defined retraction R.

Inexact RPG

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property
- F is locally Lipschitz continuous with respect to the retraction R

Theoretical results:

• If $\|\hat{\eta}_{x_k} - \eta_{x_k}^*\| \le \varepsilon_k^2$ for $\sum_{k=0}^{\infty} \varepsilon_k < \infty$ and $\varepsilon_k > 0$, then it holds that

$$\sum_{k=0}^{\infty} \operatorname{dist}(x_k, x_{k+1}) < \infty.$$

Therefore, there exists only a unique accumulation point.

Inexact RPG

Assumption:

- Assumptions for the global convergence
- f is locally Lipschitz continuously differentiable
- F satisfies the Riemannian KL property
- F is locally Lipschitz continuous with respect to the retraction R

Theoretical results:

- If $\|\hat{\eta}_{x_k} \eta_{x_k}^*\| \le \min\left(\varepsilon_k^2, \frac{\beta}{2L_F}\|\hat{\eta}_{x_k}\|^2\right)$ for $\sum_{k=0}^\infty \varepsilon_k < \infty$ and $\varepsilon_k > 0$, and if the desingularising function has the form $\varsigma(t) = \frac{C}{\theta}t^{\theta}$ for C > 0 and $\theta \in (0,1]$ for all $x \in \Omega_{x_0}$, then
 - ullet if heta=1, then the Riemannian proximal gradient method terminates in finite steps;
 - if $\theta \in [0.5, 1)$, then $||x_k x_*|| < C_1 d^k$ for $C_1 > 0$ and $d \in (0, 1)$;
 - if $\theta \in (0, 0.5)$, then $||x_k x_*|| < C_2 k^{\frac{-1}{1-2\theta}}$ for $C_2 > 0$;

ManPG [CMSZ20]

$$\eta_k = \arg\min_{\eta \in \mathrm{T}_{x_k} \mathcal{M}} \langle \nabla f(x_k), \eta \rangle + \frac{L}{2} \|\eta\|_F^2 + h(x_k + \eta)$$

Above problem can be rewritten as

$$\arg\min_{B_{\tau}^T\eta=0}\left\langle \xi_{x},\eta
ight
angle +rac{1}{2\mu}\|\eta\|_{F}^{2}+h(x+\eta)$$

where $B_x^T \eta = (\langle b_1, \eta \rangle, \langle b_2, \eta \rangle, \dots, \langle b_m, \eta \rangle)^T$, and $\{b_1, \dots, b_m\}$ forms an orthonormal basis of $N_x \mathcal{M}$.

The Lagrangian function:

$$\mathcal{L}(\eta, \Lambda) = \langle \xi_x, \eta \rangle + \frac{1}{2\mu} \langle \eta, \eta \rangle + h(X + \eta) - \langle \Lambda, B_x^T \eta \rangle.$$

Therefore

KKT:
$$\begin{cases} \partial_{\eta} \mathcal{L}(\eta, \Lambda) = 0 \\ B_{x}^{T} \eta = 0 \end{cases} \implies \begin{cases} \eta = \operatorname{Prox}_{\mu g} (x - \mu(\xi_{x} - B_{x} \Lambda)) - x \\ B_{x}^{T} \eta = 0 \end{cases}$$

where $\operatorname{Prox}_{\mu \mathbf{g}}(\mathbf{z}) = \operatorname{argmin}_{\mathbf{v} \in \mathbb{R}^{n \times p}} \frac{1}{2} \|\mathbf{v} - \mathbf{z}\|_F^2 + \mu \mathbf{h}(\mathbf{v}).$

Semi-smooth Newton method finds the Λ such that

$$\begin{split} \Psi(\Lambda) &:= B_x^T (\operatorname{Prox}_{\mu g} \left(x - \mu (\xi_x - B_x \Lambda) \right) - x) = 0 \\ \eta_* &= \operatorname{Prox}_{\mu g} \left(x - \mu (\xi_x - B_x \Lambda) \right) - x \end{split}$$

- Ψ is not differentiable everywhere but semi-smooth for $h(\cdot) = \|\cdot\|_1$;

- Step 1: compute a Riemannian proximal gradient direction (ManPG)
- **②** Step 2: compute the Riemannian proximal Newton direction, where $J(x_k)$ is from a generalized Jacobi of $v(x_k)$;
- Step 3: Update iterate by a retraction;

Riemannian version

A Riemannian proximal Newton method (RPN)

- Compute
 - $v(x_k) = \operatorname{argmin}_{v \in \mathcal{T}_{x_k} \mathcal{M}} f(x_k) + \langle \nabla f(x_k), v \rangle + \frac{1}{2t} \|v\|_F^2 + h(x_k + v);$
- **②** Find $u(x_k) \in T_{x_k} \mathcal{M}$ by solving $J(x_k)[u(x_k)] = -v(x_k),$ where $J(x_k) = -\left[I_n \Lambda_{x_k} + t\Lambda_{x_k}(\nabla^2 f(x_k) \mathcal{L}_{x_k})\right]$, Λ_{x_k} and \mathcal{L}_{x_k} are defined later :
- $x_{k+1} = R_{x_k}(u(x_k));$

Next, we will show:

- G-semismoothness of $v(x_k)$ and its generalized Jacobi;
- Superlinear convergence rate;

Riemannian version

Definition (G-Semismoothness [Gow04])

Let $F:\mathcal{D}\to\mathbb{R}^m$ where $\mathcal{D}\subset\mathbb{R}^n$ be an open set, $\mathcal{K}:\mathcal{D}\rightrightarrows\mathbb{R}^{m\times n}$ be a nonempty set-valued mapping. We say that F is G-semismooth at $x\in\mathcal{D}$ with respect to \mathcal{K} if for any $J\in\mathcal{K}(x+d)$,

$$F(x+d) - F(x) - Jd = o(||d||) \text{ as } d \to 0.$$

If F is G-semismooth at any $x \in \mathcal{D}$ with respect to \mathcal{K} , then F is called a G-semismooth function with respect to \mathcal{K} .

The standard definition of semismoothness additional requires:

- ullet ${\cal K}$ is compact valued, upper semicontinuous set-valued mapping;
- F is a locally Lipschitz continuous function;
- F is directionally differentiable at x;

[Gow04] M Seetharama Gowda. Inverse and implicit function theorems for h-differentiable and semismooth functions. Optimization Methods and Software, 19(5):443-461, 2004.

Riemannian version

v(x) (dropping the subscript for simplicity)

$$v(x) = \underset{v \in \mathcal{T}_x \mathcal{M}}{\operatorname{argmin}} \ f(x) + \langle \nabla f(x), v \rangle + \frac{1}{2t} ||v||_F^2 + h(x+v);$$

Riemannian version

v(x) (dropping the subscript for simplicity)

$$v(x) = \underset{v \in T_x \mathcal{M}}{\operatorname{argmin}} f(x) + \langle \nabla f(x), v \rangle + \frac{1}{2t} ||v||_F^2 + h(x+v);$$

Above problem can be rewritten as

$$\arg\min_{B_{\nu}^T v = 0} \langle \xi_x, v \rangle + \frac{1}{2t} \|v\|_F^2 + h(x+v)$$

where $B_x^T v = (\langle b_1, v \rangle, \langle b_2, v \rangle, \dots, \langle b_m, v \rangle)^T$, and $\{b_1, \dots, b_m\}$ forms an orthonormal basis of $T_\perp^\perp \mathcal{M}$.

Riemannian version

The Lagrangian function:

$$\mathcal{L}(v,\lambda) = \langle \xi_x, v \rangle + \frac{1}{2t} \langle v, v \rangle + h(X+v) - \langle \lambda, B_x^T v \rangle.$$

Therefore

KKT:
$$\begin{cases} \partial_{\nu} \mathcal{L}(\nu, \lambda) = 0 \\ B_{x}^{T} \nu = 0 \end{cases} \implies \begin{cases} v = \operatorname{Prox}_{th} (x - t(\xi_{x} - B_{x}\lambda)) - x \\ B_{x}^{T} \nu = 0 \end{cases}$$

where $\operatorname{Prox}_{tg}(z) = \operatorname{argmin}_{v \in \mathbb{R}^{n \times p}} \frac{1}{2} \|v - z\|_F^2 + th(v)$.

Define

$$\mathcal{F}: \mathbb{R}^n \times \mathbb{R}^{n+d} \mapsto \mathbb{R}^{n+d}: (x; v, \lambda) \mapsto \begin{pmatrix} v + x - \operatorname{Prox}_{th} \big(x - t \big[\nabla f(x) + B_x \lambda \big] \big) \\ B_x^T v \end{pmatrix}.$$

v(x) is the solution of the system $\mathcal{F}(x, v(x), \lambda(x)) = 0$;

Riemannian version

Define

$$\mathcal{F}: \mathbb{R}^n \times \mathbb{R}^{n+d} \mapsto \mathbb{R}^{n+d}: (x; v, \lambda) \mapsto \begin{pmatrix} v + x - \operatorname{Prox}_{th}(x - t[\nabla f(x) + B_x \lambda]) \\ B_x^T v \end{pmatrix}.$$

- \mathcal{F} is semismooth:
- v(x) is G-semismooth by the G-semismooth Implicit Function Theorem in [Gow04, PSS03];

[Gow04] M Seetharama Gowda. Inverse and implicit function theorems for h-differentiable and semismooth functions. Optimization Methods and Software, 19(5):443-461, 2004.

[PSS03] Jong-Shi Pang, Defeng Sun, and Jie Sun. Semismo oth homeomorphisms and strong stability of semidefinite and Lorentz complementarity problems. Mathematics of Operations Research, 28(1):39-63, 2003.

Riemannian version

Lemma (Semismooth Implicit Function Theorem)

Suppose that $F: \mathbb{R}^n \times \mathbb{R}^m \to \mathbb{R}^m$ is a semismooth function with respect to $\partial_B F$ in an open neighborhood of (x^0,y^0) with $F(x^0,y^0)=0$. Let $H(y)=F(x^0,y)$, if every matrix in $\partial_C H(y^0)$ is nonsingular, then there exists an open set $\mathcal{V}\subset \mathbb{R}^n$ containing x^0 , a set-valued function $\mathcal{K}: \mathcal{V}\to \mathbb{R}^{m\times n}$, and a G-semismooth function $f: \mathcal{V}\to \mathbb{R}^m$ with respect to \mathcal{K} satisfying $f(x^0)=y^0$, for every $x\in \mathcal{V}$,

$$F(x,f(x))=0,$$

and the set-valued function K is

$$\mathcal{K}: x \mapsto \{-(A_y)^{-1}A_x : [A_x \ A_y] \in \partial_{\mathrm{B}}F(x, f(x))\},\,$$

where the map $x \mapsto \mathcal{K}(x)$ is compact valued and upper semicontinuous.

Not new but an arrangement of existing results.

Riemannian version

Without loss of generality, we assume that the nonzero entries of x_* are in the first part, i.e., $x_* = [\bar{x}_*^T, 0^T]^T$

Assumption

Let $B_{x_*}^{\mathrm{T}} = [\bar{B}_{x_*}^{\mathrm{T}}, \hat{B}_{x_*}^{\mathrm{T}}]$, where $\bar{B}_{x_*} \in \mathbb{R}^{j \times d}$ and $\hat{B}_{x_*} \in \mathbb{R}^{(n-j) \times d}$. It is assumed that $j \geq d$ and \bar{B}_{x_*} is full column rank.

Riemannian version

Without loss of generality, we assume that the nonzero entries of x_* are in the first part, i.e., $x_* = [\bar{x}_*^T, 0^T]^T$

Assumption

Let $B_{x_*}^{\mathrm{T}} = [\bar{B}_{x_*}^{\mathrm{T}}, \hat{B}_{x_*}^{\mathrm{T}}]$, where $\bar{B}_{x_*} \in \mathbb{R}^{j \times d}$ and $\hat{B}_{x_*} \in \mathbb{R}^{(n-j) \times d}$. It is assumed that $j \geq d$ and \bar{B}_{x_*} is full column rank.

v(x) is a G-semismooth function of x in a neighborhood of x_*

Under the above Assumption, there exists a neighborhood \mathcal{U} of x_* such that $v:\mathcal{U}\to\mathbb{R}^n:x\mapsto v(x)$ is a G-semismooth function with respect to \mathcal{K}_v , where

$$\mathcal{K}_{v}: x \mapsto \left\{-[\mathrm{I}_{n}, \ 0]B^{-1}A : [A \ B] \in \partial_{\mathrm{B}}\mathcal{F}\big(x, v(x), \lambda(x)\big)\right\}.$$

For $x \in \mathcal{U}$, any element of $\mathcal{K}_{\nu}(x)$ is called a generalized Jacobi of ν at x.

Here, the semismooth implicit function theorem is used

Riemannian version

The generalized Jacobi of v at x is

$$\begin{split} \Big\{ \mathcal{J}_x \ | \mathcal{J}_x[\omega] &= - \left[\mathrm{I}_n - \Lambda_x + t \Lambda_x (\nabla^2 f(x) - \mathcal{L}_x) \right] \omega - M_x B_x H_x (\mathrm{D} B_x^{\mathrm{T}}[\omega]) v, \forall \omega \\ M_x &\in \partial_C \mathrm{prox}_{th}(x) \Big\}, \end{split}$$

where $\Lambda_x = M_x - M_x B_x H_x B_x^T M_k$, $H_x = (B_x^T M_x B_x)^{-1}$, $\mathcal{L}_x(\cdot) = \mathcal{W}_x(\cdot, B_x \lambda(x))$, and \mathcal{W}_x denotes the Weingarten map;

- $v(x_*) = 0$;
- Set $J(x) = I_n \Lambda_x + t\Lambda_x(\nabla^2 f(x) \mathcal{L}_x);$
- The Riemannian proximal Newton direction: J(x)u(x) = -v(x);
- Let $u(x) = (\bar{u}(x); \hat{u}(x))$, then

$$\hat{u}(x) = \hat{v}$$
 and $\bar{J}(x)\bar{u}(x) = -\bar{v}(x)$

Riemannian version

Assumption:

① Let $B_{\mathbf{x}_*}^T = [\bar{B}_{\mathbf{x}_*}^T, \hat{B}_{\mathbf{x}_*}^T]$, where $\bar{B}_{\mathbf{x}_*} \in \mathbb{R}^{j \times d}$ and and $\hat{B}_{\mathbf{x}_*} \in \mathbb{R}^{(n-j) \times d}$. It is assumed that $j \geq d$ and $\bar{B}_{\mathbf{x}_*}$ is full column rank;

Riemannian version

Assumption:

- Let $B_{\mathbf{x}_*}^T = [\bar{B}_{\mathbf{x}_*}^T, \hat{B}_{\mathbf{x}_*}^T]$, where $\bar{B}_{\mathbf{x}_*} \in \mathbb{R}^{j \times d}$ and and $\hat{B}_{\mathbf{x}_*} \in \mathbb{R}^{(n-j) \times d}$. It is assumed that $j \geq d$ and $\bar{B}_{\mathbf{x}_*}$ is full column rank;
- ② There exists a neighborhood \mathcal{U} of $x_* = [\bar{x}_*^T, 0^T]^T$ on \mathcal{M} such that for any $x = [\bar{x}^T, \tilde{x}^T]^T \in \mathcal{U}$, it holds that $\bar{x} + \bar{v} \neq 0$ and $\hat{x} + \hat{v} = 0$.

$$v(x) = \underset{v \in \mathcal{T}_x \mathcal{M}}{\operatorname{argmin}} f(x) + \langle \nabla f(x), v \rangle + \frac{1}{2t} ||v||_F^2 + h(x+v)$$

Riemannian version

Assumption:

- Let $B_{\mathbf{x}_*}^T = [\bar{B}_{\mathbf{x}_*}^T, \hat{B}_{\mathbf{x}_*}^T]$, where $\bar{B}_{\mathbf{x}_*} \in \mathbb{R}^{j \times d}$ and and $\hat{B}_{\mathbf{x}_*} \in \mathbb{R}^{(n-j) \times d}$. It is assumed that $j \geq d$ and $\bar{B}_{\mathbf{x}_*}$ is full column rank;
- ② There exists a neighborhood \mathcal{U} of $x_* = [\bar{x}_*^T, 0^T]^T$ on \mathcal{M} such that for any $x = [\bar{x}^T, \tilde{x}^T]^T \in \mathcal{U}$, it holds that $\bar{x} + \bar{v} \neq 0$ and $\hat{x} + \hat{v} = 0$.

Theorem

Suppose that x_* be a local optimal minimizer. Under the above Assumptions, assume that $J(x_*)$ is nonsingular. Then there exists a neighborhood $\mathcal U$ of x_* on $\mathcal M$ such that for any $x_0 \in \mathcal U$, RPN Algorithm generates the sequence $\{x_k\}$ converging superlinearly to x_* .

Riemannian version

Assumption:

- Let $B_{\mathbf{x}_*}^T = [\bar{B}_{\mathbf{x}_*}^T, \hat{B}_{\mathbf{x}_*}^T]$, where $\bar{B}_{\mathbf{x}_*} \in \mathbb{R}^{j \times d}$ and and $\hat{B}_{\mathbf{x}_*} \in \mathbb{R}^{(n-j) \times d}$. It is assumed that $j \geq d$ and $\bar{B}_{\mathbf{x}_*}$ is full column rank;
- ② There exists a neighborhood \mathcal{U} of $x_* = [\bar{x}_*^T, 0^T]^T$ on \mathcal{M} such that for any $x = [\bar{x}^T, \tilde{x}^T]^T \in \mathcal{U}$, it holds that $\bar{x} + \bar{v} \neq 0$ and $\hat{x} + \hat{v} = 0$.

Theorem

Suppose that x_* be a local optimal minimizer. Under the above Assumptions, assume that $J(x_*)$ is nonsingular. Then there exists a neighborhood $\mathcal U$ of x_* on $\mathcal M$ such that for any $x_0 \in \mathcal U$, RPN Algorithm generates the sequence $\{x_k\}$ converging superlinearly to x_* .

If the intersection of manifold and sparsity constraints forms an embedded manifold around x_* , then $\nabla^2 \bar{f}(x_*) - \bar{\mathcal{L}} \succeq 0$. If $\nabla^2 \bar{f}(x_*) - \bar{\mathcal{L}} \succ 0$, then $J(x_*)$ is nonsingular.

Riemannian version

Smooth case:
$$\min_{x \in \mathcal{M}} f(x)$$

KKT conditions:

$$\nabla f(x) + \frac{1}{t}v + B_x\lambda = 0, \text{ and } B_x^Tv = 0;$$

Closed form solutions:

$$\lambda(x) = -B_x^{\mathrm{T}} \nabla f(x), \qquad v = -t \operatorname{grad} f(x);$$

• Action of J(x): for $\omega \in T_x \mathcal{M}$

$$J(x)[\omega] = -tP_{T_x \mathcal{M}}(\nabla^2 f(x) - \mathcal{L}_x)P_{T_x \mathcal{M}}\omega = -t\operatorname{Hess} f(x)[\omega]$$

- $J(x)u(x) = -v(x) \Longrightarrow \operatorname{Hess} f(x)[u(x)] = -\operatorname{grad} f(x);$
- It is the Riemannian Newton method;

Numerical Experiments

Sparse PCA problem

$$\min_{X \in \text{St}(r,n)} - \text{trace}(X^T A^T A X) + \mu ||X||_1,$$

where $A \in \mathbb{R}^{m \times n}$ is a data matrix and $\operatorname{St}(r,n) = \{X \in \mathbb{R}^{n \times r} \mid X^T X = I_r\}$ is the compact Stiefel manifold.

- $R_x(\eta_x) = (x + \eta_x)(I + \eta_x^T \eta_x)^{-1/2}$;
- $t = 1/(2||A||_2^2)$;
- Run ManPG until ||v|| reaches 10^{-4} , i.e., it reduces by a factor of 10^3 . The resulting x as the input of RPN;

Numerical Experiments

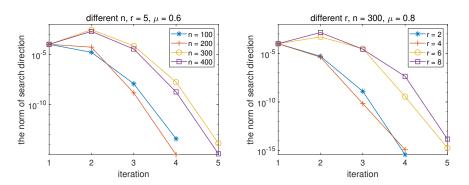

Figure: Random data. Left: different $n=\{100,200,300,400\}$ with r=5 and $\mu=0.6$; Right: different $r=\{2,4,6,8\}$ with n=300 and $\mu=0.8$

Summary and Future Work

Summary:

- A non-exhaustive review of nonsmooth optimization on manifolds;
- Euclidean/Riemannian proximal gradient methods;
- Inexact versions;
- Euclidean/Riemannian proximal Newton methods;

Future work:

- Accelerated version: $O(1/k^2)$ convergence rate analysis;
- Globalization for Riemannian Newton method;
- Design a Riemannian quasi-Newton method with superlinear local convergence rate;
- Generalize those methods to generic manifolds;

Thank you

Thank you!
